NIH StrokeNET National Coordinating Center

University of Cincinnati

MUSC Medical University of South Carolina

NIH

University of Cincinnati

Agenda—Morning

8:45 am – 9:15 am	Welcome/Updates NDMC NINDS	Pooja Khatri Jordan Elm Scott Janis
9:15 am – 9:30 am	Training Core Update	Randy Marshall Devin Brown
9:30 am – 9:45 am	CRP Core Update	Heena Olalde Kinga Aitken
9:45 am – 10:45 am	ARCADIA-CSI Final Results & ARCADIA Secondary Results Discussion	David Tirschwell Maarten Lansberg Ron Lazar Hooman Kamel
10:45 am – 11:30 am	Themes for priority setting conferences	Pooja Khatri Steve Cramer Karen Johnston Hooman Kamel
11:30 am – 12:00 pm	Break and grab lunch to bring back to the room	

NIH StrokeNet
PREVENTION | TREATMENT | RECOVERY

Agenda—Afternoon

*****Reassemble in Salon at 12:00pm for working lunch*****

12:00 pm – 12:45 pm	Keynote Speaker "Embedding pragmatic trials within emergency and critical care" **Matthew Semler, MD** Associate Professor of Medicine, Anesthesiology, and Biomedical Informatics Associate Director of the Medical Intensive Care Unit Director, Center for Learning Healthcare Vanderbilt University

Please Note: The breakout sessions below will not be livestreamed. Remote attendees rejoin at 2:15pm

12:45 pm – 2:00 pm	Breakout session: Small group discussion on themes for priority setting conferences. There will be 3 groups:		
	• Recovery Group	Florida	Sean Savitz, Maarten Lansberg
	• Prevention Group	Alabama	Cheryl Bushnell, Randy Marshall
	• Acute Group	Salon C	Enrique Leira, Mark Alberts
2:00 pm – 2:15 pm	Break		
2:15 pm – 3:15 pm	Reassemble in Salon: Moderators to summarize small group discussions for larger group considerations. Each group will have 10 minutes for summary and 10 minutes for Q&A.		
3:15 pm – 3:30 pm	Questions/wrap-up		

NIH StrokeNet
PREVENTION | TREATMENT | RECOVERY

Housekeeping

- **Wifi** Marriott Conference
  - Access code: encore (don't need room #)
- **Online link**: https://tinyurl.com/4b3pw3n8
- **Restrooms** towards lobby (two rights after exiting room)
- **Charging stations** are on left and right of room
- Can leave **luggage** in Salon B (locked during mtg)
- **Parking passes** – see Rose or Kristine if not in your name badge holder
- **Airport buses** at 4pm
- Please ask your questions and bring your ideas today!

NIH StrokeNet
PREVENTION | TREATMENT | RECOVERY

Trial Portfolio as of Today

9 Studies Completed

- 6 Definitive (including 2 platform) and 2 Pilot Trials
- 1 Ancillary Study

1 Paused

15 Ongoing Studies

- 11 Trials, 3 Ancillary Studies, 1 Biomarker Validation Study

1 New Trial Funded

NIH StrokeNet
PREVENTION | TREATMENT | RECOVERY

Completed Studies

PREVENTION OF STROKE (2)

ARCADIA No evidence of benefit of apixaban for stroke with evidence of atrial cardiopathy

- **ARCADIA-CSI** Cognition and silent infarcts – final results pending

PRIMARY STROKE PREVENTION IN COVID (2)

ACTIV 4C Platform Antithrombotic approach for patients discharged from hospital with COVID-19

ACTIV 4A Platform Antithrombotic approach for inpatient COVID-19 pts

ACUTE STROKE TREATMENT (4)

MISTIE 3 No evidence of benefit of minimally invasive surgery for ICH evacuation

DEFUSE 3 Large treatment benefit of EVT for imaging selected patients at 4.5-16h from onset

I-DEF Futility of deferoxamine for three-month outcomes after ICH

MOST No evidence of benefit of adjunctive epfibatide or argatroban with intravenous thrombolysis

STROKE RECOVERY & REHABILITATION (1)

TELEREHAB Noninferiority of telehealth to in-person, dose-matched post-stroke rehabilitation

Completed Studies

PREVENTION OF STROKE (2)

ARCADIA No evidence of benefit of apixaban for stroke with evidence of atrial cardiopathy

- **ARCADIA-CSI** Cognition and silent infarcts – final results pending

PRIMARY STROKE PREVENTION IN COVID (2)

ACTIV 4C Platform Antithrombotic approach for patients discharged from hospital with COVID-19

ACTIV 4A Platform Antithrombotic approach for inpatient COVID-19 pts

ARCADIA primary paper (JAMA)
Secondary analyses today

ARCADIA CSI primary results today

Therapeutically anticoagulated noncritically ill pts but not critically ill pts (NEJM X 2)

No benefit of P2Y12 Inhibitors, SGLT2 inhibitors, or P-Selectin-Inhibitor Crizanlizumab
(JAMA, Lancet Diabetes Endocrin, Circulation)

Completed Studies

Paved for next ICH evac trials

Global impact on acute stroke care

Raised awareness of 6 month outcomes for ICH

Primary paper in NEJM this month

Precursor to newly funded Telerehab-2

ACUTE STROKE TREATMENT (4)

MISTIE 3 No evidence of benefit of minimally invasive surgery for ICH evacuation

DEFUSE 3 Large treatment benefit of EVT for imaging selected patients at 4.5-16h from onset

I-DEF Futility of deferoxamine for three-month outcomes after ICH

MOST No evidence of benefit of adjunctive epfibatide or argatroban with intravenous thrombolysis

STROKE RECOVERY & REHABILITATION (1)

TELEREHAB Noninferiority of telehealth to in-person, dose-matched post-stroke rehabilitation

15 Ongoing Trials/Studies

PREVENTION OF STROKE (9)

CREST-2 Endarterectomy/stenting of asymptomatic carotid stenosis (N=2486/2480)

- **CREST-H** Cognitive outcomes in hemodynamically impaired subset (N=392/385)

Sleep-SMART Treatment of obstructive sleep apnea (Ph 3, N=1601/3062)

SATURN Statin continuation in ICH survivors (N=600/1426)

- **SATURN-MRI** Silent stroke (N=229/894)

ASPIRE Apixiban for afib after ICH (N=340/700)

CAPTIVA Anticoagulation vs antiplatelets for intracranial stenosis (N=514/1683)

- **CAPTIVA MRI** Biomarkers of recurrent stroke in intracranial atherosclerotic stenosis (N=3/300)

FOCAS Corticosteroids for pediatric stroke due to focal cerebral arteriopathy (N=8/80)

ACUTE STROKE TREATMENT (3)

FASTEST FVIIa for acute ICH (N=543/860)

SISTER Novel clot-dissolving Ab, TS23, for ischemic stroke (N=9/300)

STEP Platform Registry-supported trial platform to optimize outcomes after LVO and MVO

STROKE RECOVERY & REHABILITATION (3)

TRANSPORT-2 Transcranial direct stimulation for UE recovery (N=129/129)

I-ACQUIRE Intensive infant rehabilitation for ischemic stroke (N=215/216)

VERIFY Acute prediction of UE motor recovery and function (N=252/657)

Telerehab-2 Telehealth in home vs usual care for UE motor function (N=0/202)

Prevention Updates

PREVENTION OF STROKE (9)

CREST-2 Endarterectomy/stenting of asymptomatic carotid stenosis (N=2486/2480)

- **CREST-H** Cognitive outcomes in hemodynamically impaired subset (N=392/385)

Sleep-SMART Treatment of obstructive sleep apnea (Ph 3, N=1601/3062)

SATURN Statin continuation in ICH survivors (N=600/1426)

- **SATURN-MRI** Silent stroke (N=229/894)

ASPIRE Apixiban for afib after ICH (N=340/700)

CAPTIVA Anticoagulation vs antiplatelets for intracranial stenosis (N=514/1683)

- **CAPTIVA MRI** Biomarkers of recurrent stroke in intracranial atherosclerotic stenosis (N=3/300)

FOCAS Corticosteroids for pediatric stroke due to focal cerebral arteriopathy (N=8/80)

Completed enrollment 10/JUL/2024!
CEA-MED follow up completed SEPT/2024 and CAS-MED follow up to be completed on 31/JUL/2025

CREST-H in follow up as well!

Prevention aim on hold as of 28/JUN/2024

Recovery aim ongoing (sample size reduction)

StrokeNet Thrombectomy Endovascular Platform

Acute and Recovery Updates

ACUTE STROKE TREATMENT (3)

FASTEST FVIIa for acute ICH (N=543/860)

SISTER Novel clot-dissolving Ab, TS23, for ischemic stroke (N=9/300)

STEP Platform Registry-supported trial platform to optimize outcomes after LVO and MVO

→ Key interim analysis in December

FDA approved amendment to incorporate an enrichment and promising zone design

→ New assets under active development

STROKE RECOVERY & REHABILITATION (4)

TRANSPORT-2 Transcranial direct stimulation for UE recovery (N=129/129)

I-ACQUIRE Intensive infant rehabilitation for ischemic stroke (N=215/216)

VERIFY Acute prediction of UE motor recovery and function (N=252/657)

Telerehab-2 Telehealth in home vs usual care for UE motor function (startup, N=202)

→ Completed enrollment 24/May/2024 and last follow up last week!

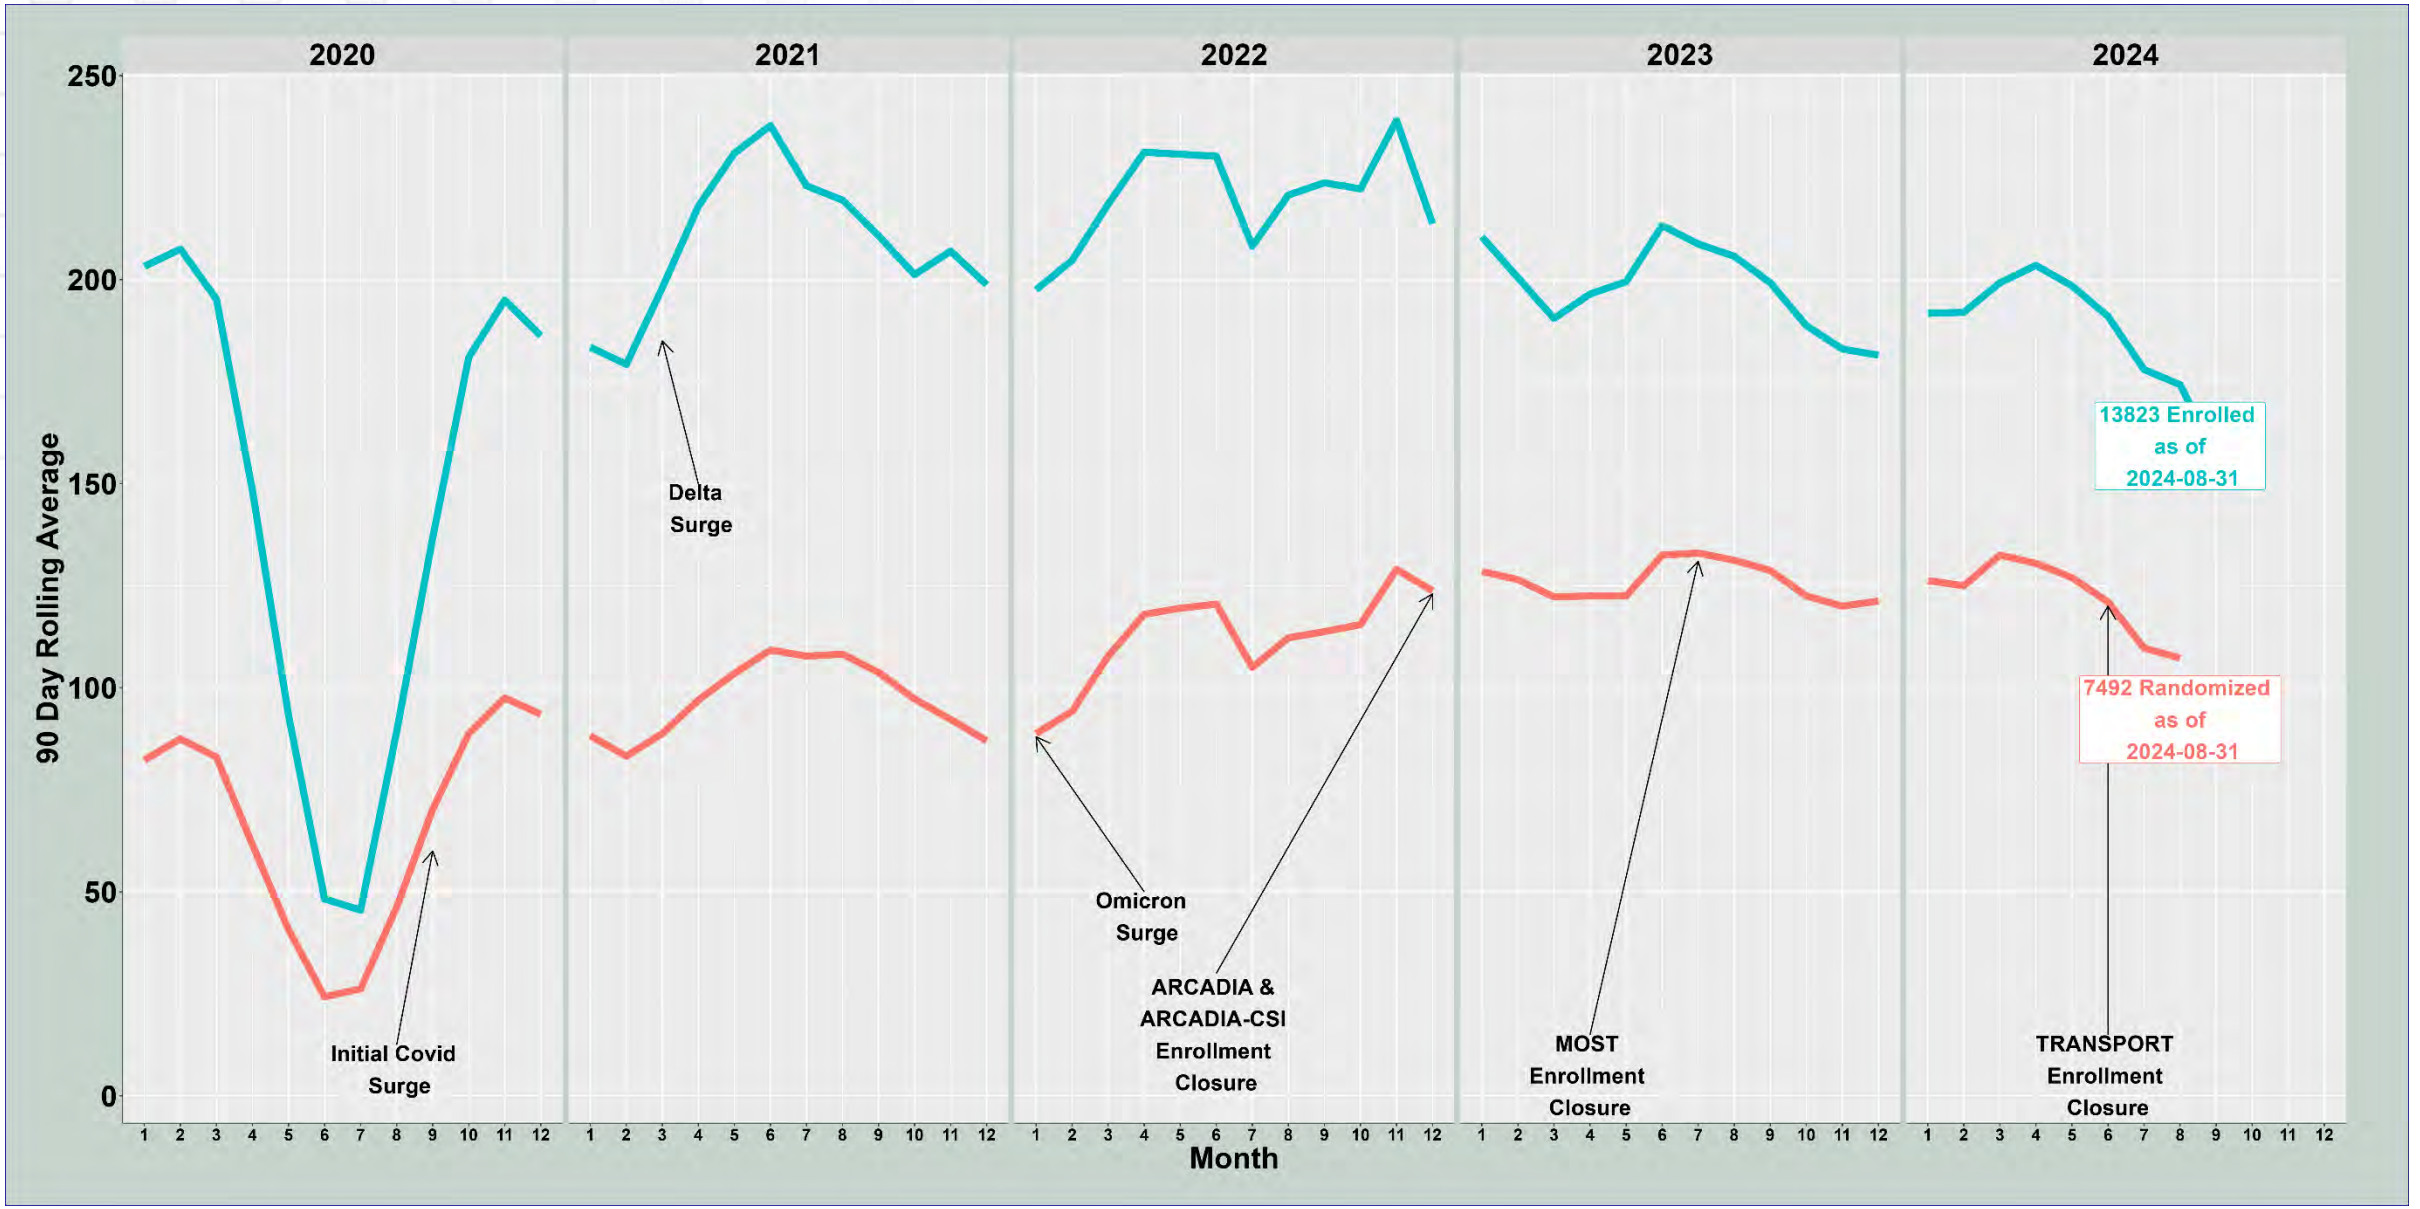
Anticipate results at ISC 2025

→ Almost completed enrollment!
12 months follow up remaining

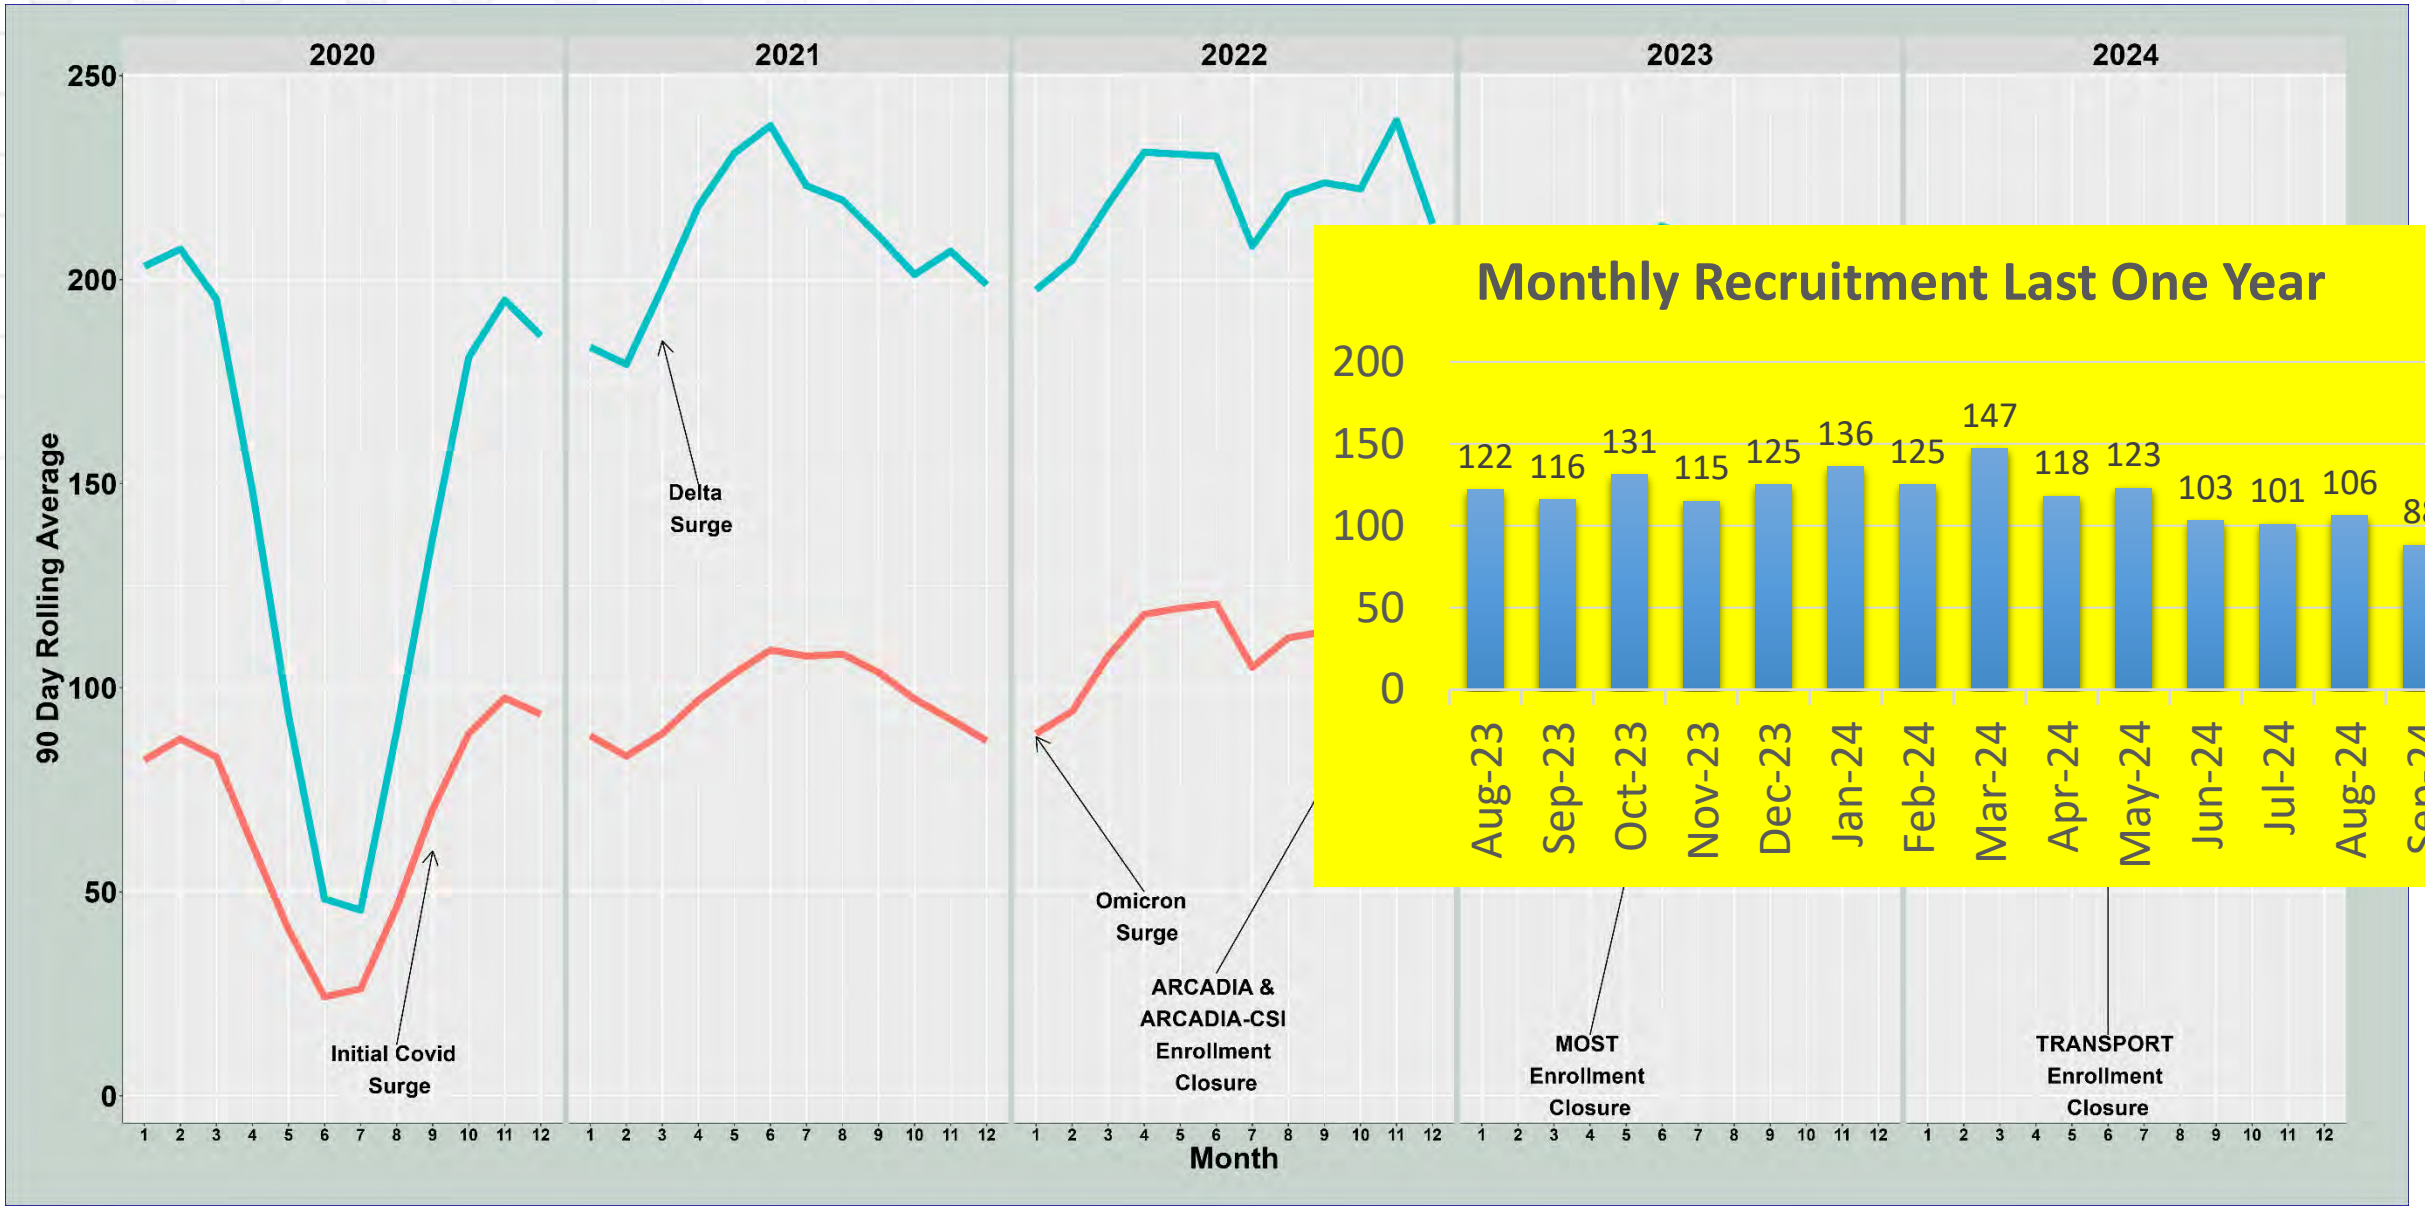
NEW

StrokeNet Thrombectomy Endovascular Platform

>13,000 Enrolled and >7000 Randomized



>13,000 Enrolled and >7000 Randomized



Examples of Innovative Design Features

- Adaptive enrichment – DEFUSE-3
- Multi-arm, multistage – MOST, CAPTIVA
- Patient-Reported Outcome -- Utility-weighted modified Rankin – MOST, FASTEST, STEP
- Covariate adjusted randomization – Telerehab, iACQUIRE, MOST, SATURN, TRANSPORT2
- Response adaptive randomization – Sleep SMART, MOST, SISTER, STEP
- Sample size re-estimation – ARCADIA, Sleep SMART, ASPIRE, SATURN
- Step forward randomization – FASTEST
- Emergency consent – FASTEST
- Infant population – iACQUIRE
- Utility function – SISTER
- Randomized, embedded, multifactorial, adaptive platform (REMAP) – STEP
- Registry-supported – STEP

International Trials

Note 1. Only subjects counting towards the sample size are included.
2. Subjects enrolled in ancillary studies are not counted separately, because they have been counted in their parent projects.
3. Percentages in the Total row are obtained by the total subject counts in the demographic category divided by total subjects enrolled across all projects.
4. Data in this report are updated daily. Subjects enrolled within 24 hours may be not included.

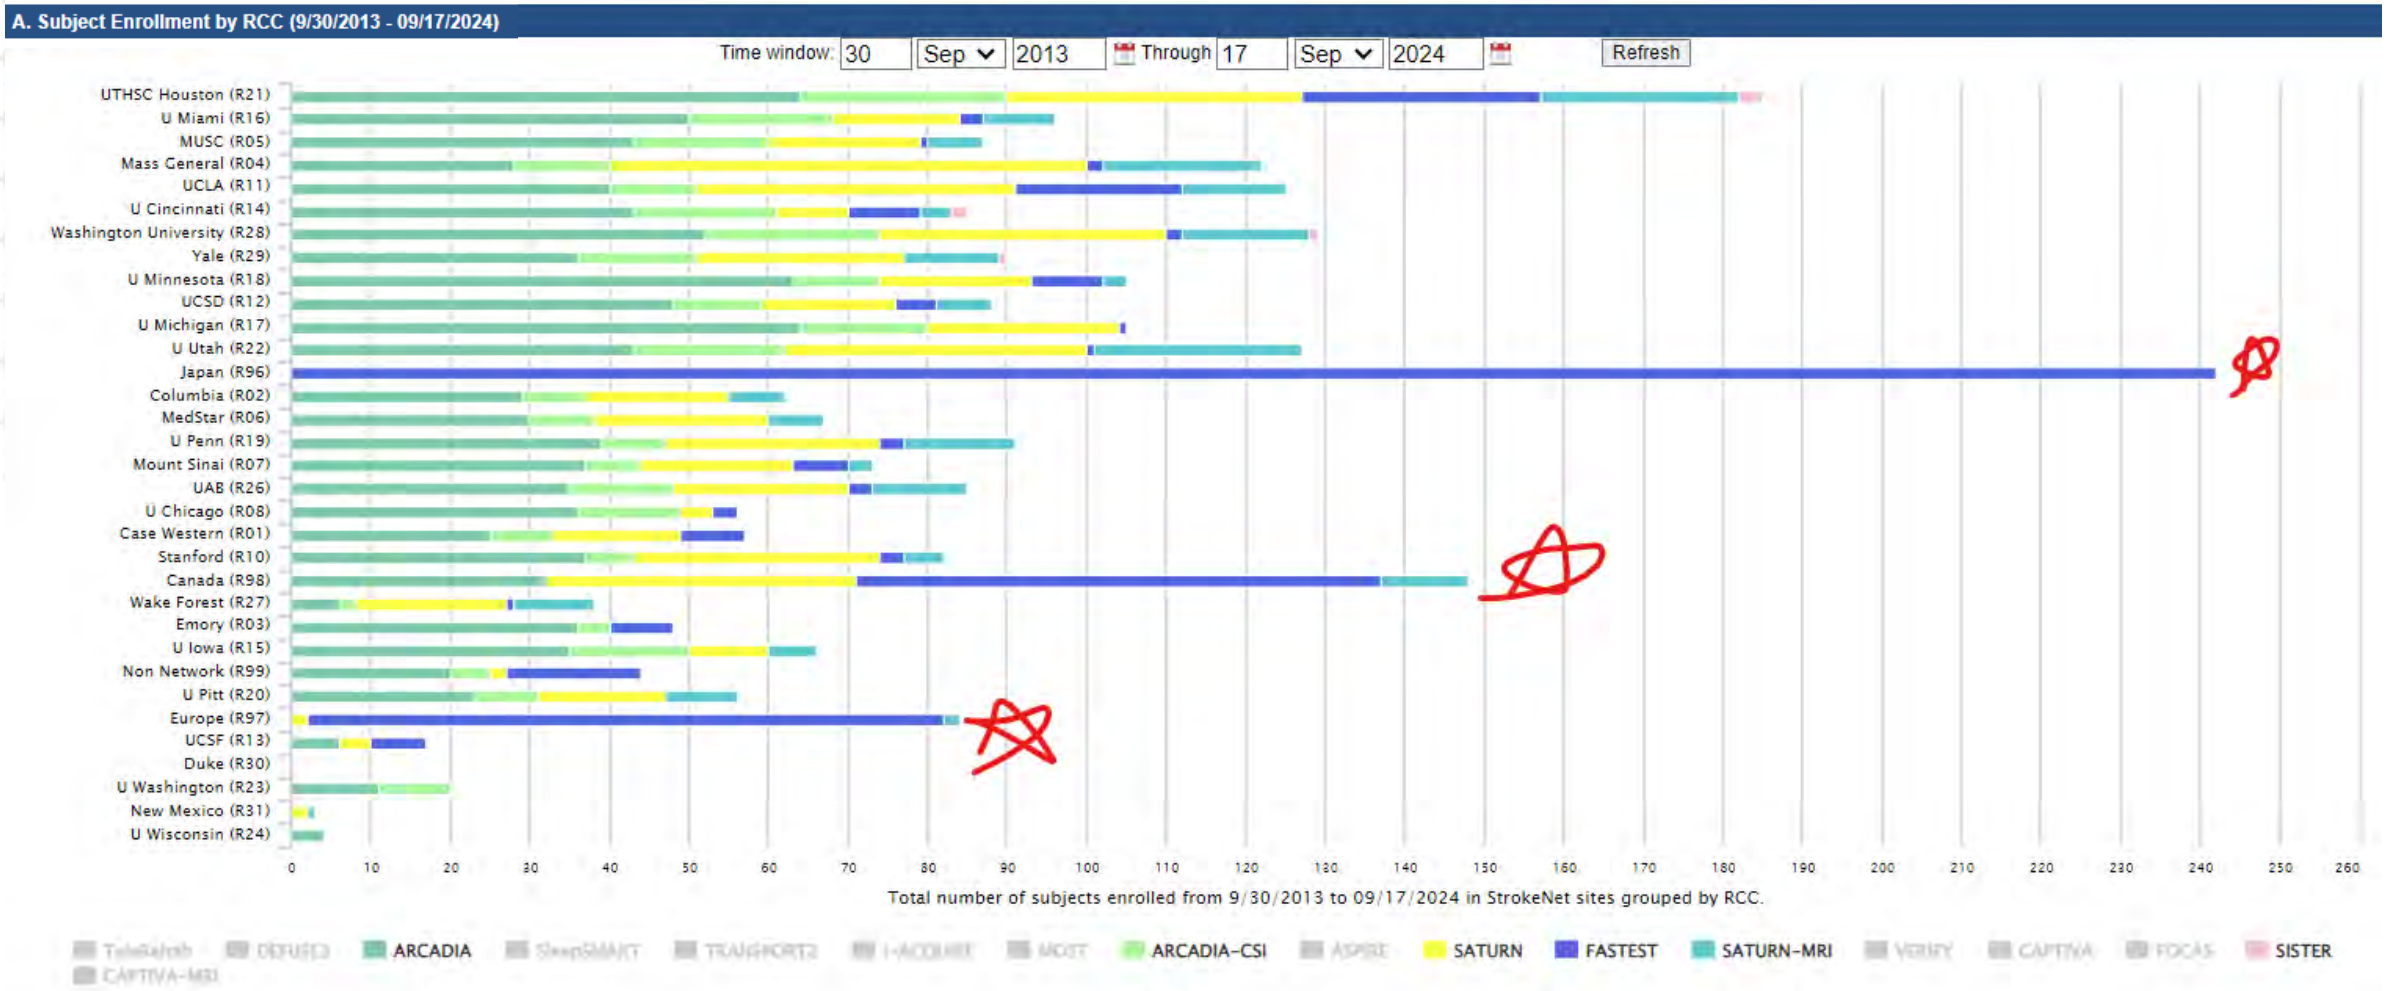
Increased International Trials: Subject Enrollment



WebDCU upgrade to .NET platform

- 2-factor user authentication
- Increased data security protection
- More robust tools for data validation logic rules and skip pattern set up
- Future StrokeNet studies -- new platform upon development
- Ongoing StrokeNet studies - upgraded platform over the coming year(s)

Standardization to increase efficiency

- CRFs -- library form structure, includes data field definitions, code, data validation rules, skip patterns, and associated emails
- Enhance the system stability, increase new project development efficiency and facilitate cross-project summary report generation.
- Integration of procedures at clinical sites, central pharmacy, central lab, and safety and efficacy outcome adjudication team members

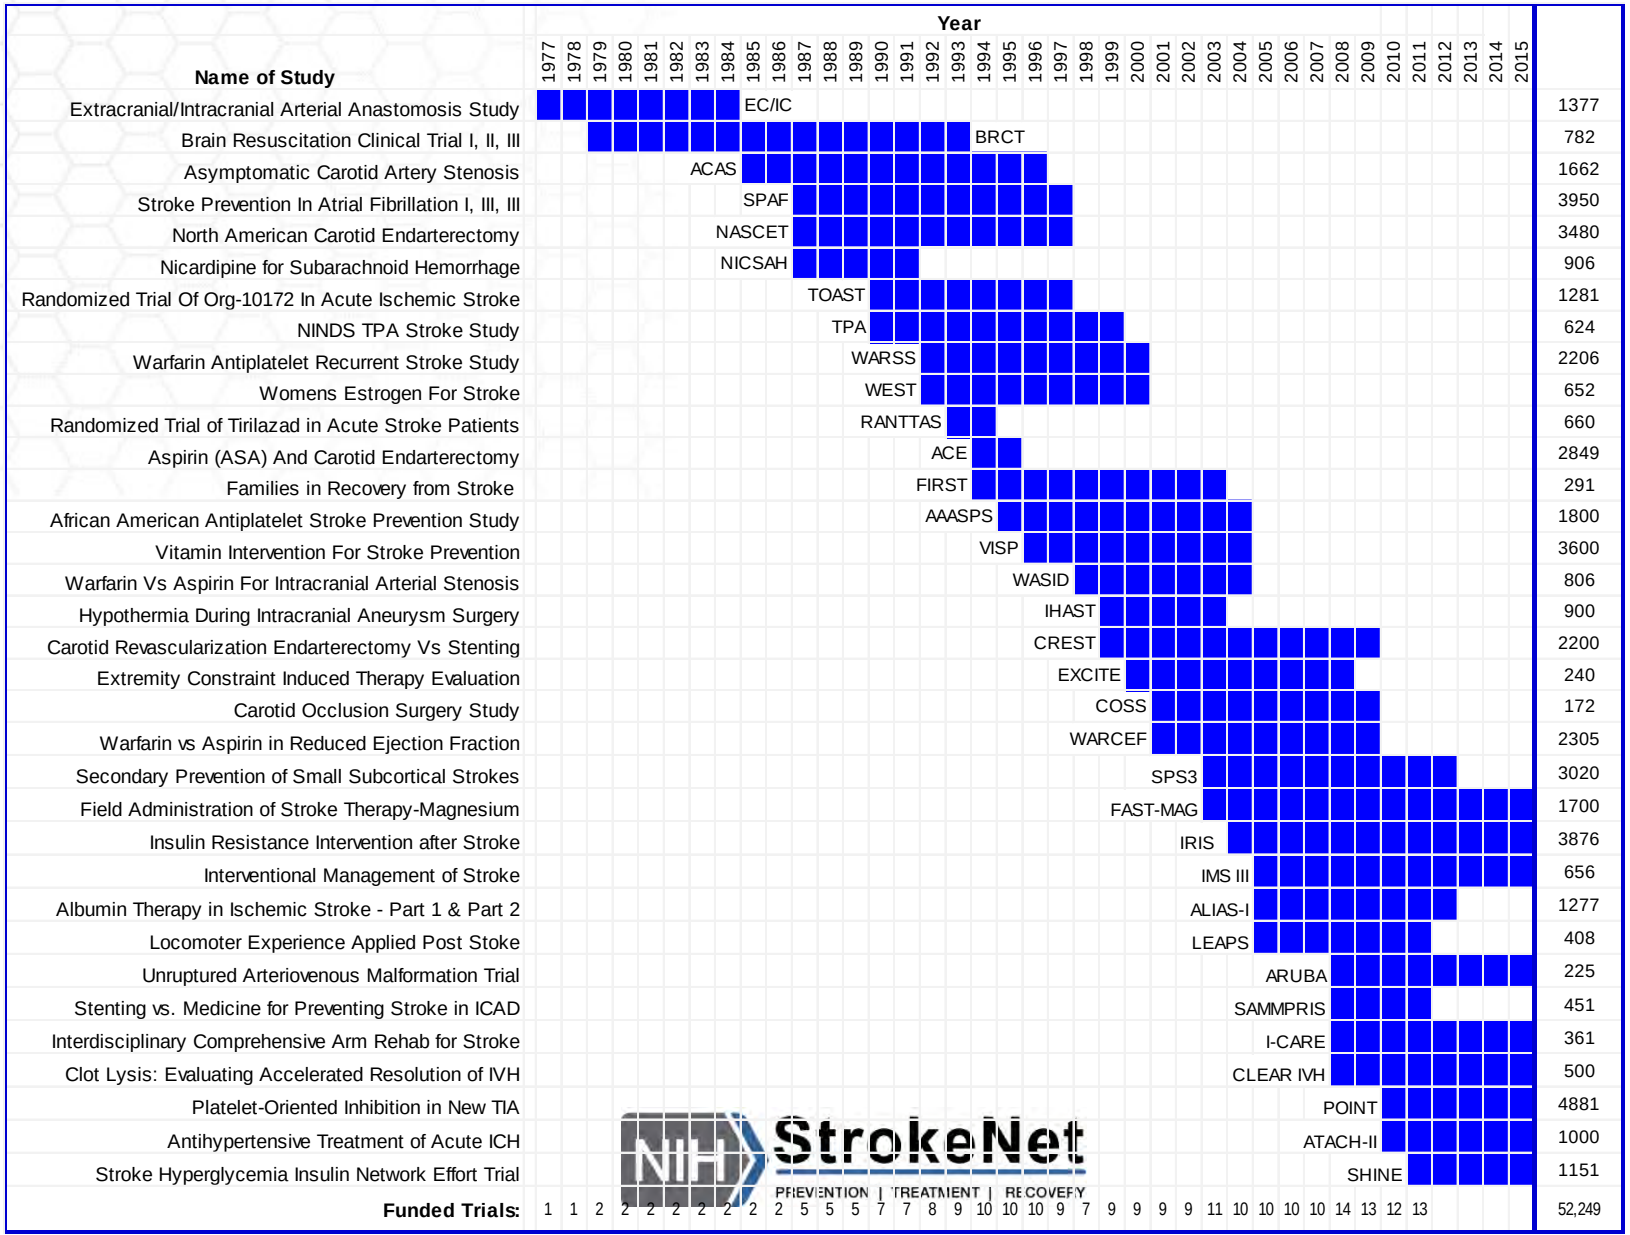
Major Clinical Trials in Stroke 1977-2011



Getting NINDS Trials Started

- The Extracranial - Intracranial Bypass Trial
  - Started 1977
  - Ended 1984
  - Pivotal event in history of stroke clinical trials
  - Established that the stroke community could tackle very difficult questions and get answers that would be accepted and applied in practice
  - Set high standards of performance
- Brain Resuscitation Clinical Trial
  - Emergency consent

The Stroke Master Agreement

- Pilot studies
- Led to three trials
  - TOAST
  - NICSAH
  - NINDS TPA Study
- NIH Stroke Scale
- 50 center network

Clot-Dissolving Drug Offers New Hope for Victims of Stroke

More May Have Full Recovery

By David Brown

A daring and sometimes risky treatment for stroke can substantially increase a person's chance of full recovery, provided it is administered within three hours of first symptoms, according to a new study.

The treatment could alter the outcome of one of mankind's more devastating diseases, but to do so it first will have to revolutionize the behavior of patients and their doctors.

Although most people with stroke still suffer functional brain damage, the new study's finding that at least one-third more people can be saved from permanent disability than with current practices amounts to the biggest improvement in stroke care ever. About 500,000 Americans suffer strokes each year.

The study involved 624 patients and tested the safety and usefulness of tissue plasminogen activator (t-PA), a clot-dissolving drug now used in the treatment of heart attacks. About 80 percent of strokes are caused by blood clots, which either form in a blood vessel in the brain or travel there from elsewhere in the body.

Twenty percent of patients who did not get t-PA had a full recovery from their stroke when evaluated by neurological examination three months later. Of those who got t-PA, 31 percent recovered. Three other measurements of daily functioning were also used and they showed a 30 to 50 percent greater likelihood of recovery in t-PA patients.

"T-PA treatment can make a real difference to [patients'] neurological outcome, and to their overall daily functioning," said Thomas Brott, a physician at the University of Cincinnati and one of the leaders of the study, speaking at a news conference yesterday.

About 400,000 of the strokes suffered by Americans each year are caused by blood clots, and theoretically

Research on stroke is among National Institute of Neurological component of the Federal govern

- Develop regional stroke center networks that will improve information-sharing and collaboration among health care providers, both regionally and nationally.

SPOTRIAS. **In May 2001, NINDS initiated the SPOTRIAS, to facilitate translation of basic research findings into clinical practice in settings where patients with acute ischemic and hemorrhagic stroke are evaluated and treated very rapidly after onset of their symptoms. Broader goals of this program include career development opportunities for new investigators, sharing of human tissue resources, and encouragement of collaborations among investigators across institutions.**

Stroke Research Priorities Meeting 2012

Research Priority Setting

A Summary of the 2012 NINDS Stroke Planning Meeting Report

Barbara G. Vickrey, MD, MPH; Thomas G. Brott, MD; on behalf of the Stroke Research Priorities Meeting Steering Committee and the National Advisory Neurological Disorders and Stroke Council; Walter J. Koroshetz, MD; on behalf of the National Institute of Neurological Disorders and Stroke

Prevention

1) Prevention of Vascular Cognitive Impairment (VCI)
2) Imaging Biomarkers in Stroke Prevention: From Bench to Bedside
3) Expediting High Priority Comparative Effectiveness Research (CER) Trials in Stroke Prevention

Treatment

1) Preclinical and Clinical Studies to Improve Early Reperfusion Therapy and Establish Limitations of Late Reperfusion Therapy
2) Preclinical and Clinical Studies to Achieve Robust Brain Protection
3) Expand and Integrate Existing Stroke Trial Networks to Accelerate Translation

Recovery

1) Translational Research Using Neural Interface Devices for Stroke and Other Neurologic Disorders
2) Program for Translational Research Targeting Early Recovery after Stroke in Humans

Cross-cutting

Accelerate the Translation of Stroke Research in Preclinical Animal Models into Clinical Studies of Highly Promising Treatments

The NINDS Stroke Clinical Trial Network (NIH StrokeNet)

Infrastructure established in 2013; renewed in 2018 and 2023

Goals:

- Maximize efficiencies to develop and conduct a balanced portfolio of high-quality, multi-site phase 1, 2 and 3 clinical trials in stroke prevention, treatment, and recovery
  - Includes biomarker validation and ancillary studies to StrokeNet trials
- Educate future stroke researchers

Infrastructure:

- National Coordinating Center (NCC)
- National Data Management and Statistical Center (NDMC)
- 27 Regional Coordinating Centers (RCCs) with clinical performance and satellite sites representing over 700 stroke hospitals (including Canada, Europe, and Japan)
- Central Institutional Review Board; central research pharmacy, imaging core, and a training and education core
- Each RCC has annual support for portion of a trainee's effort

Clinical trials and studies funded separately from the infrastructure, through peer-reviewed funding mechanisms open to investigators from academia, foundations, or industry

of the National Advisory Neurological Disorders and Stroke (NANDS) Council

- Presentation to the NANDS Council
- February 2, 2022

NIH StrokeNet
PREVENTION | TREATMENT | RECOVERY

Top-line Recommendations

Top 2 Recommendations

Proactively identify priorities

Monumentally improve pre-award/review efficiency

Strengthen internal and external community engagement

Set explicit goals to address equity, diversity, and inclusion and resource achieving them

Enhance clinical workforce development, readiness, and retention

Strengthen regular network evaluation and timely improvement

NIH StrokeNet
PREVENTION | TREATMENT | RECOVERY

Workable solutions based on the NINDS Clinical Networks Evaluation Working Group

Proactively identify priorities

- Work with community (through workshops/conferences, strategic planning) to identify areas of high unmet need and scientific priority
- Strengthen generation of research ideas through existing network structures, (e.g. disease area interest groups)
- Require appropriate representation of diverse populations

Monumentally improve pre-award/review efficiency

- Innovate and accelerate Network award and review processes
- Streamline NINDS extramural pre-review processes
- Consider Administrative Core for non-academic coordination functions

Strengthen regular network evaluation and timely improvement

- Develop 5-year network evaluation plan
- Conduct Listening Sessions with investigators and community partners 2x/year for input on performance

Strengthen internal and external community engagement

Set explicit goals to address equity, diversity, and inclusion and resources for achieving them

Enhance clinical workforce development, readiness, and retention

StrokeNet Thrombectomy Platform (STEP)

Objective: To determine the optimal strategy for treatment of patients with Arterial Ischemic Stroke (AIS) due to Large Vessel Occlusions (LVOs) or Medium Vessel Occlusions (MVOs)

Population: Patients with AIS due to proximal large or distal medium vessel occlusion who are potentially amenable to endovascular therapy

1995 - 2018

- 1999 - EMS Bridging Trial
- 2004 - IMS I
- 2007 - IMS II
- 2012 - DEFUSE 2
- 2012 - IMS III
- 2012 - MR RESCUE
- 2018 - DEFUSE 3

2018 - 2023

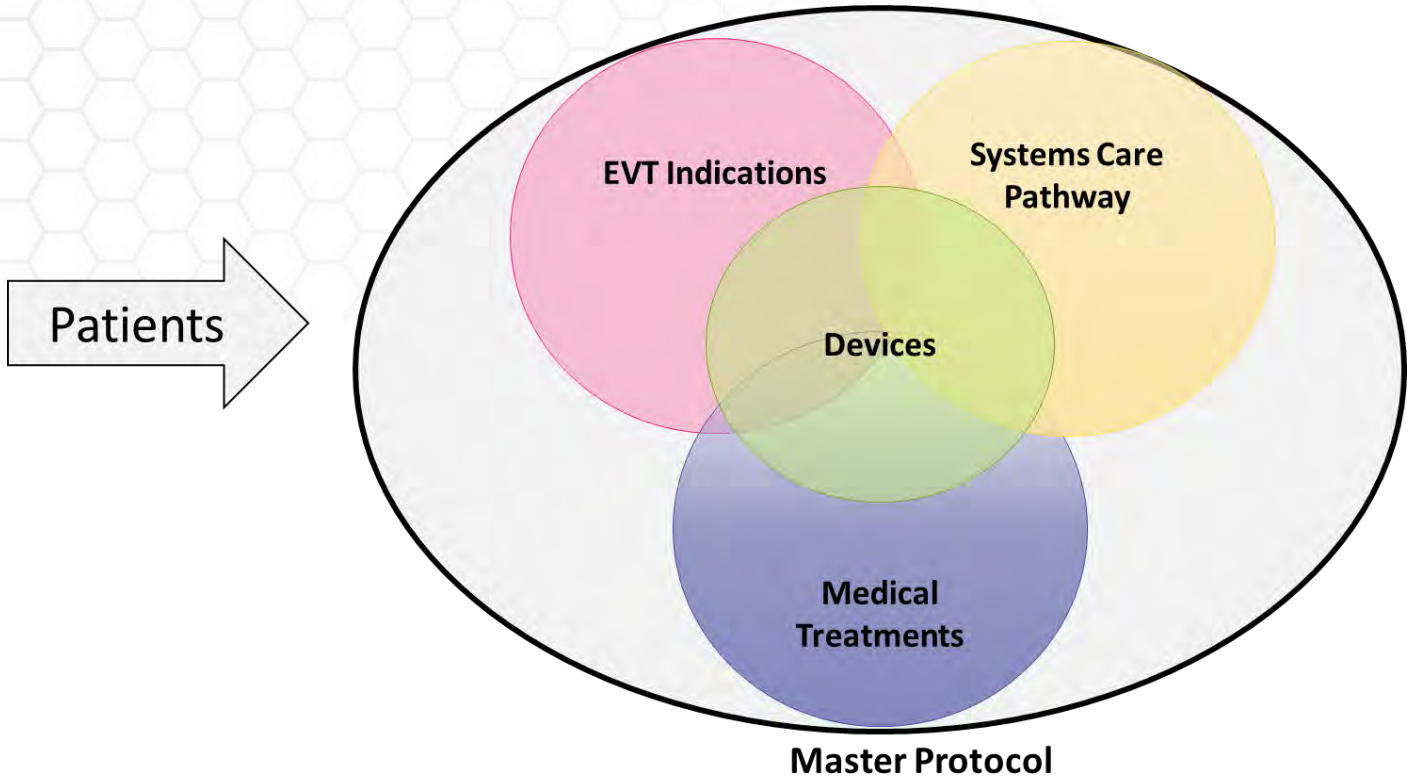
Patients	>10,000	>550	>1000	>1000	>20,000

Building of previous and growing experience, the NINDS pursued a clinical trial platform to answer the many questions that we have been receiving in the EVT space

What types of questions for STEP



Clinical trials that will address:

- Indication expansion of current endovascular therapy (EVT) criteria
  - *e.g., EVT for low NIHSS, children, etc.*
- Concomitant medical therapies added to EVT
  - *e.g., BP control, avoiding tPA, general anesthesia or sedation, novel neuroprotective agents, etc.*
- Systems of care for EVT
  - *e.g., prehospital identification for EVT routing, etc.*
- Novel EVT devices

How to Apply – Research Opportunity Announcement

Participating Organization(s)	National Institutes of Health (NIH)
Components of Participating Organizations	National Institute of Neurological Disorders and Stroke (NINDS)
Research Opportunity Title	**StrokeNet Thrombectomy Platform (STEP) – Domain Clinical trials to be conducted in STEP: Stage 1 Preliminary Application (OT2)**
Activity Code	OT2: Application for an Other Transaction Agreement
Research Opportunity Number	OTA-24-009

Key Dates:	Posted Date: February 8, 2024
	Open Date (Earliest Submission Date): March 1, 2024
	Application Due Date(s): Rolling Submission

13 Proposals already submitted

- Biospecimen Core funded for baseline blood collection
  - 24hr blood draw
  - Isolation of DNA that can be used for genetics and epigenetics and RNA for transcriptomics
  - Isolation of plasma for proteomic analyses
  - ***Future opportunities*** for R01 applications

https://www.ninds.nih.gov/funding/find-funding-opportunities/research-opportunity-announcements

Workable solutions based on the NINDS Clinical Networks Evaluation Working Group

Proactively identify priorities

- Work with community (through workshops/conferences, strategic planning) to identify areas of high unmet need and scientific priority
- Strengthen generation of research ideas through existing network structures, (e.g. disease area interest groups)
- Require appropriate representation of diverse populations

Monumentally improve pre-award/review efficiency

- Innovate and accelerate Network award and review processes
- Streamline NINDS extramural pre-review processes
- Consider Administrative Core for non-academic coordination functions

Strengthen regular network evaluation and timely improvement

- Develop 5-year network evaluation plan
- Conduct Listening Sessions with investigators and community partners 2x/year for input on performance

Strengthen internal and external community engagement

Set explicit goals to address equity, diversity, and inclusion and resources for achieving them

Enhance clinical workforce development, readiness, and retention

Setting our priorities

- Again, NINDS is engaged in a planning our next set of stroke priorities. But this time we are looking to leverage the scientific powerhouse we have in the network to work with our broader stroke community.
- Goal is not to use our time to pitch the trials we are working on.
- Identify scientific gaps and the opportunities that we can use our stroke network to advance.
- Starting with the network as a think tank. Then will move to include the boarder stroke community.
- The format will be a Princeton like conference that we will support through a conference grant.
- Objective is to help us (NINDS) prioritize funding and look for opportunities to streamline our research mechanisms (i.e., STEP and SPAN).
- ALL voices are important! We are here and we are listening…

Education and Training Core Update

Randolph Marshall, MD, MS
Devin Brown, MD
September 30, 2024
Atlanta, GA

Education and Training Core

- Mission: To develop stroke-related knowledge and skills for RCC trainees through interactive content and mentorship

- Vision: To become the preeminent platform for education and training of future leaders in stroke research

Metrics

- Mandatory attendance on Grand Rounds Webinars, Professional Development webinars, participation in Learning Communities
- Mandatory trainee presentations
  - In-person at national meeting (3)
  - Remote during a special, mentored 3-hour session (9)
  - Time slots during the Professional Development Webinar series (16)
- Other service activity to the StrokeNet Community (e.g. trainee volunteer on the Education and Training Core.)
- End of year survey: publications, grant submissions, professional appointments post-StrokeNet training
- Database kept by Jeanne Sester

Optional opportunities (available to all)

- Single observation of a Working Group meeting
- Attend StrokeNet Steering Committee Meetings (monthly)
- Track enrollment in StrokeNet trials/studies

Brand new and recently implemented programming

- Trainee attendance at Clinical Trial/Study Executive Committee Meetings
  - CAPTIVA (2)
  - VERIFY (1)
  - I-ACQUIRE (1)
- Trainee members of Working Groups
  - Acute (2)
  - Prevention (2)
  - Rehab/Recovery (2)

Engagement of current trainees

Training Core Members	Ryan (Duke), Eklund (U Colorado)
Acute stroke Working Group	McCartin (U Chicago), Paixao (U Miami)
Prevention Working Group	Chakravarthula (U Minnesota), Ramaswamy (Columbia)
Rehab/recovery Working Group	Rodriguez (U Michigan), Shu (Yale)
CAPTIVA Exec Committee	Eklund (U Colorado), Rotta (MGH)
VERIFY Exec Committee	Shu (Yale)
I-ACQUIRE Exec Committee	Bhayana (UT Houston)

Reminder: Deadlines

- Request for new Trainees' training plans – May
- Solicit Grand Rounds Webinar topics and speakers – May
- Survey to Trainees – June
- Final Trainee Progress report – June
- Trainee Contact form – June
- Update from prior trainees – June

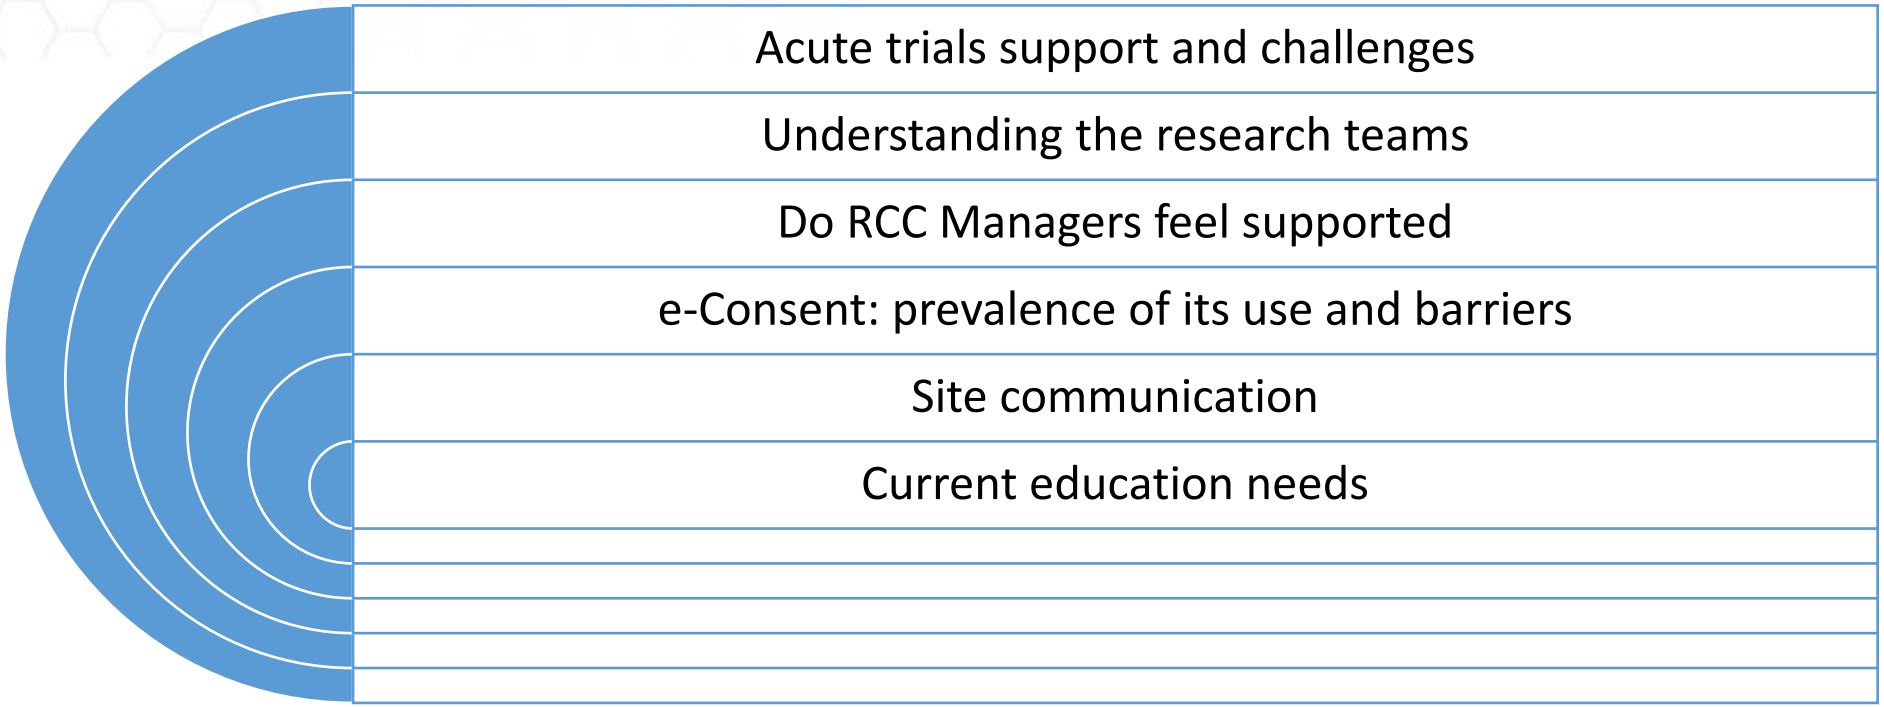
Summary of activities

- Nov 2023- Jan 2024: baseline assessments, RCC one-on-one meetings
  - Data collected from 25 RCC (1 RCC didn't have a manager, 1 new RCC that wasn't set up)
- Continued new RCC manager mentoring



Acute trials support and challenges

9 RCC without 24/7 after hours coverage

- Not a dedicated 24/7 coordinator
- Not expected to come in over nights/weekend.
- No additional pay. Comp time is offered if the coordinator happens to stay after hours
- IDS Pharmacy is expensive after business hours
- Limited pharmacy hours
- Small team, no back-up coordinators

16 RCCs with 24/7 or limited after hours coverage (7am-11pm or similar)

- Few sites have an actual call schedule for coordinators
- Higher salaries to compensate for on call
- Acute stroke recruitment is done remotely (clinicians are boots on the ground)
- Hard work/life balance for the 24/7 coordinators, lots of turn over
- Research pharmacy is 24/7
- The coordinator is on call 24/7 by their choice. No back up coordinator coverage

Understanding the research teams

- Have mix of RNs, CCRPs, non-licensed or certified research assistants, International medical graduates, post bac interns, etc.
- Clear career path- 3 levels of coordinators: 1. Entry level (e.g. RA1), 2. Experienced coordinators(e.g. RA2), 3.Research nurse coordinators
- Some of the research coordinators do not have reliable clinical knowledge
- Most RCCs have CTSAs
- Optional training opportunities exist at most sites

Do RCC Managers feel supported?

Yes

- Engaged PIs who have great working relationships with Manager and team
- Supportive department that recognizes the hard work and prestige
- Weekly meetings with stroke attendings
- Ability to work in a hybrid model has been helpful for work life balance

No

- Feels lost, did not get much education when transitioning to manager role
- Concepts are a bit abstract
- Past year has been hard
- StrokeNet coordinator for a long time, regulatory duties are new and challenging
- Being understaffed

eConsent: usage and barriers

Positives:

- Most RCCs and satellites have some version of eConsent currently approved for use
- Most sites are comfortable with remote consent and eConsent in the acute setting
- A few sites have dedicated tablets and are trying to use mostly eConsent
- Only 4 RCCs are paper only

Negatives:

- Challenging to use, especially in person, for older patients
- Some institutions strongly prefer paper for in person interactions
- Lack of dedicated tablet for research purposes

e-Consent needs

- Clear top to bottom expectation coming from StrokeNet
- Possibly providing a tablet to use for consent with future trials
- Educational session to increase comfort

Site communication

Mostly direct communication: in person, email, phone, text

Current education needs

- Short, pragmatic how-to videos and slides on basics (source documentation, how to make a correction, AE/SAE reporting, checklists)
- Reorganization of the existing resources and WebDCU Toolbox
- Re-naming of webinars, abstracting the education to a separate slide deck, # system to make it searchable by keywords
- One on one mentorship is helpful, should be consistent for all new RCC managers
- Strengthening stroke knowledge, SOC vs research, imaging, etc.
- Lunch and Learns, in person boot camps for coordinators/ managers where cases are discussed on a peer-to-peer basis
- Clear definition of roles and responsibilities between study team members (PI/Sub-I/fellow/manager/coordinators/trial specific central PM)

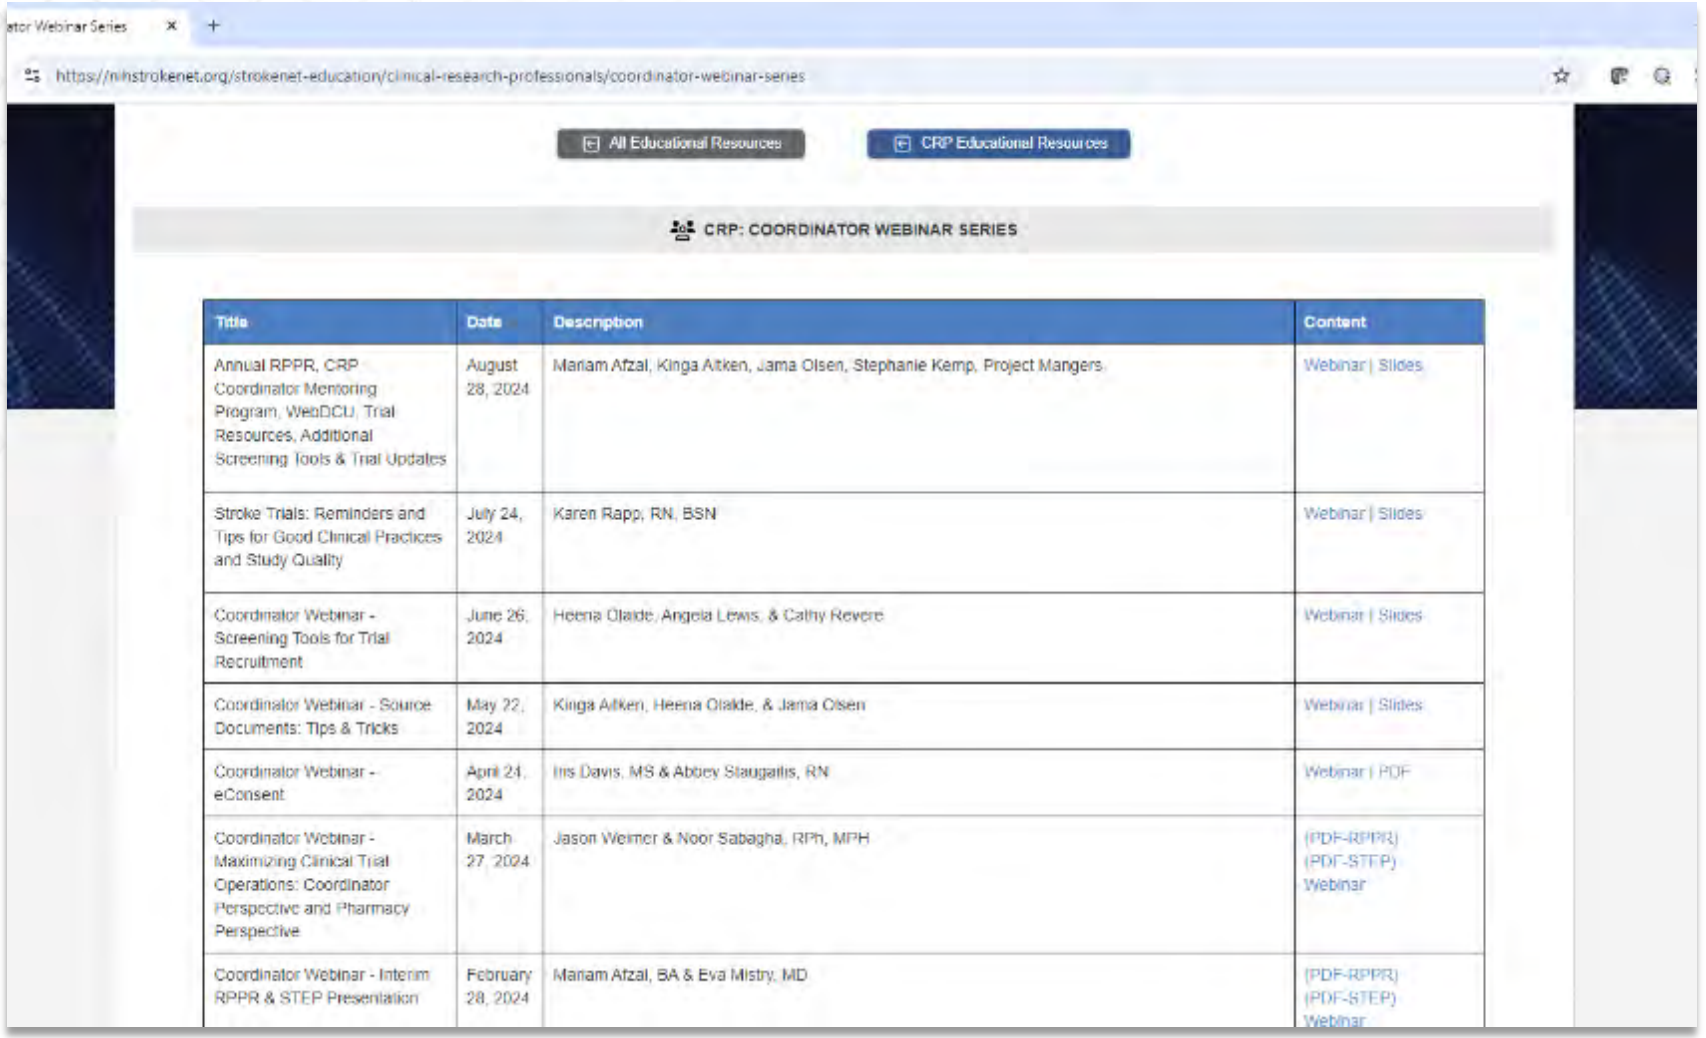
Coordinator Webinars



Title	Date	Description	Content
Annual RPPR, CRP Coordinator Mentoring Program, WebDCU, Trial Resources, Additional Screening Tools & Trial Updates	August 28, 2024	Mariam Afzal, Kinga Aitken, Jama Olsen, Stephanie Kemp, Project Mangers	Webinar | Slides
Stroke Trials: Reminders and Tips for Good Clinical Practices and Study Quality	July 24, 2024	Karen Rapp, RN, BSN	Webinar | Slides
Coordinator Webinar - Screening Tools for Trial Recruitment	June 26, 2024	Heena Olalde, Angela Lewis, & Cathy Revere	Webinar | Slides
Coordinator Webinar - Source Documents: Tips & Tricks	May 22, 2024	Kinga Aitken, Heena Olalde, & Jama Olsen	Webinar | Slides
Coordinator Webinar - eConsent	April 24, 2024	Iris Davis, MS & Abbey Staugaitis, RN	Webinar | PDF
Coordinator Webinar - Maximizing Clinical Trial Operations: Coordinator Perspective and Pharmacy Perspective	March 27, 2024	Jason Weimer & Noor Sabagha, RPh, MPH	(PDF-RPPR) (PDF-STEP) Webinar
Coordinator Webinar - Interim RPPR & STEP Presentation	February 28, 2024	Mariam Afzal, BA & Eva Mistry, MD	(PDF-RPPR) (PDF-STEP) Webinar

Future webinars

- October 2024 - Career advancement: Abby Staugaitis, Dave Haney and Mariam Afzal
- Integration of clinical care & research: PI and coordinator perspective
- Grant management 101, everything an RCC manage must know (Mariam Afzal)
- WebDCU navigation
- Roles and responsibilities for PI, Sub-I, RCC Manager, Trial Coordinators
- Collaboration with DEI Core

NEW CRP Mentoring Program

- Open to any CRC participating in at least 1 SN trial
- Small group, interactive learning sessions w/ mentor
  - Max 5 mentees/ mentor
- Certificate of completion offered
  - can be used towards professional clinical research certification/re-certification
- Mentors: subject matter experts vetted by the CRP Core
- Go live: January 1, 2025

Topics

Topics from 4 sections:

- StrokeNet policy
- Consenting (e.g. role play, eConsent, tech back method)
- Regulatory and Data Management (GCP, documentation best practices, start-ups, cIRB reliance Cincinnati vs Advarra, Monitoring)
- Communication and professionalism
  (e.g. how to communicate with clinicians/pts/families)

Additional Education Topics?

What other educational topics would you like to see the StrokeNet CRP core address in the coming months?

Please contact co-chairs:

- Heena Olalde at heena-olalde@uiowa.edu
- Kinga Aitken at kinga.aitken@hsc.utah.edu

Questions?

On Treatment Analysis

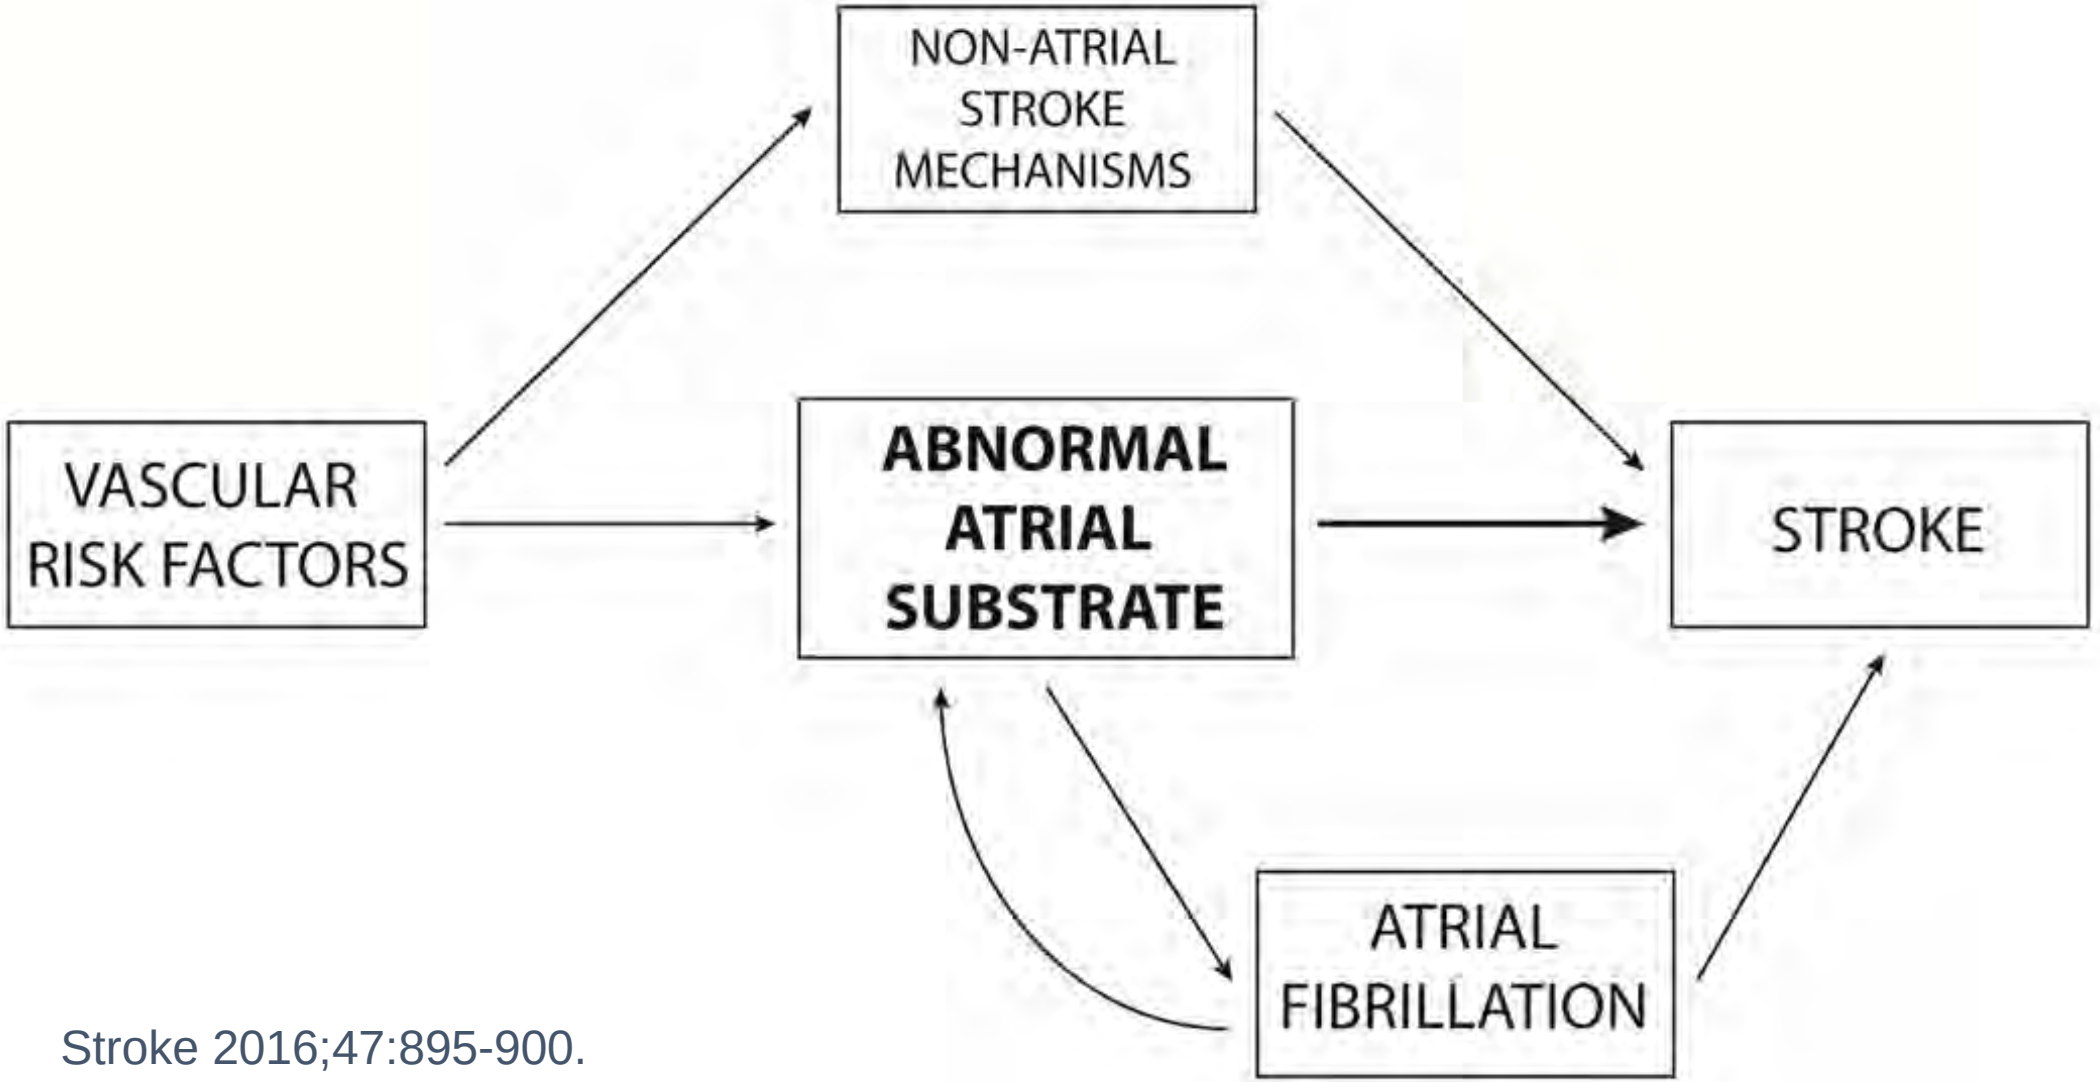
…a work in progress!

David Tirschwell, WT Longstreth Jr., Mitchell Elkind, Richard Kronmal, Hooman Kamel for the ARCADIA Investigators

Table I Definition of atrial cardiomyopathy

'Any complex of structural, architectural, contractile or electrophysiological changes affecting the atria with the potential to produce clinically-relevant manifestations'.

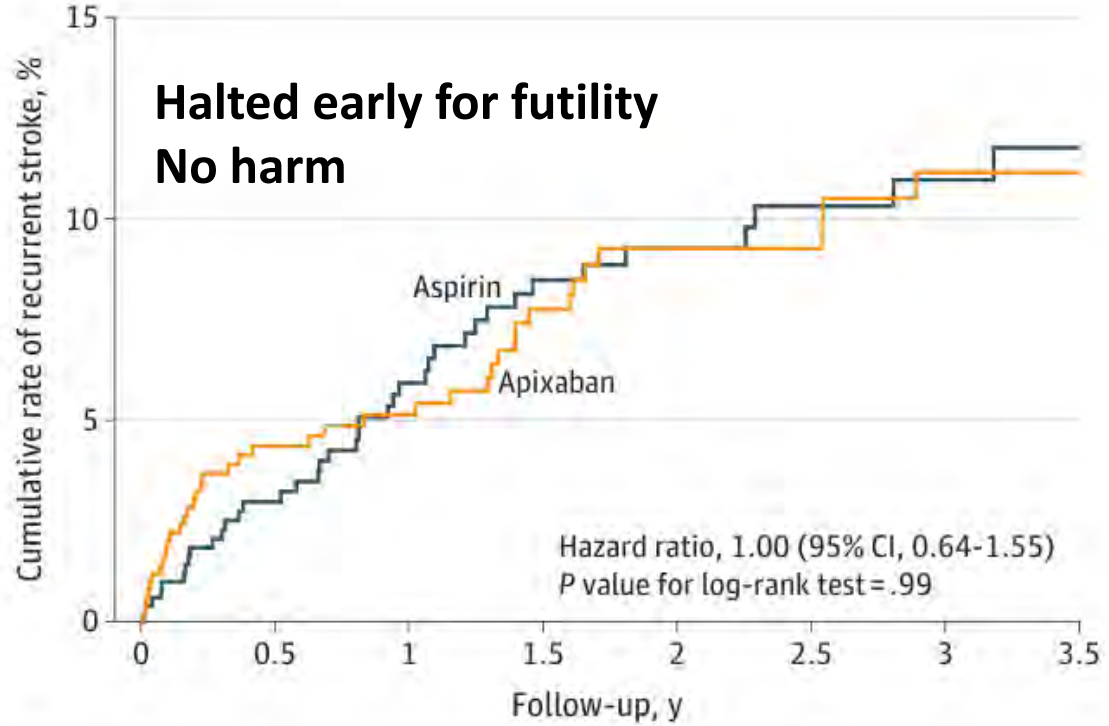
J Arrhythm. 2016 Aug;32(4):247-78



Stroke 2016;47:895-900.

ARCADIA Trial – Overview, ITT results

- Double blind RCT
- Recent cryptogenic stroke
- Atrial Cardiopathy
  - Serum marker (NT-proBNP)
  - ECG marker (PWTFV1)
  - ECHO marker (LADI)
- Aspirin vs. Apixaban
- 1° Outcome: time to recurrent stroke of any type
- ITT survival analysis



No. at risk								
Apixaban	507	400	327	256	188	146	121	74
Aspirin	508	395	317	262	195	145	119	74

Recurrent stroke included stroke of ischemic, hemorrhagic, or unknown type. The mean (SD) follow-up period in both groups was 1.8 (1.3) years.

NIH StrokeNet PREVENTION | TREATMENT | RECOVERY

JAMA.2024;331(7):573-581

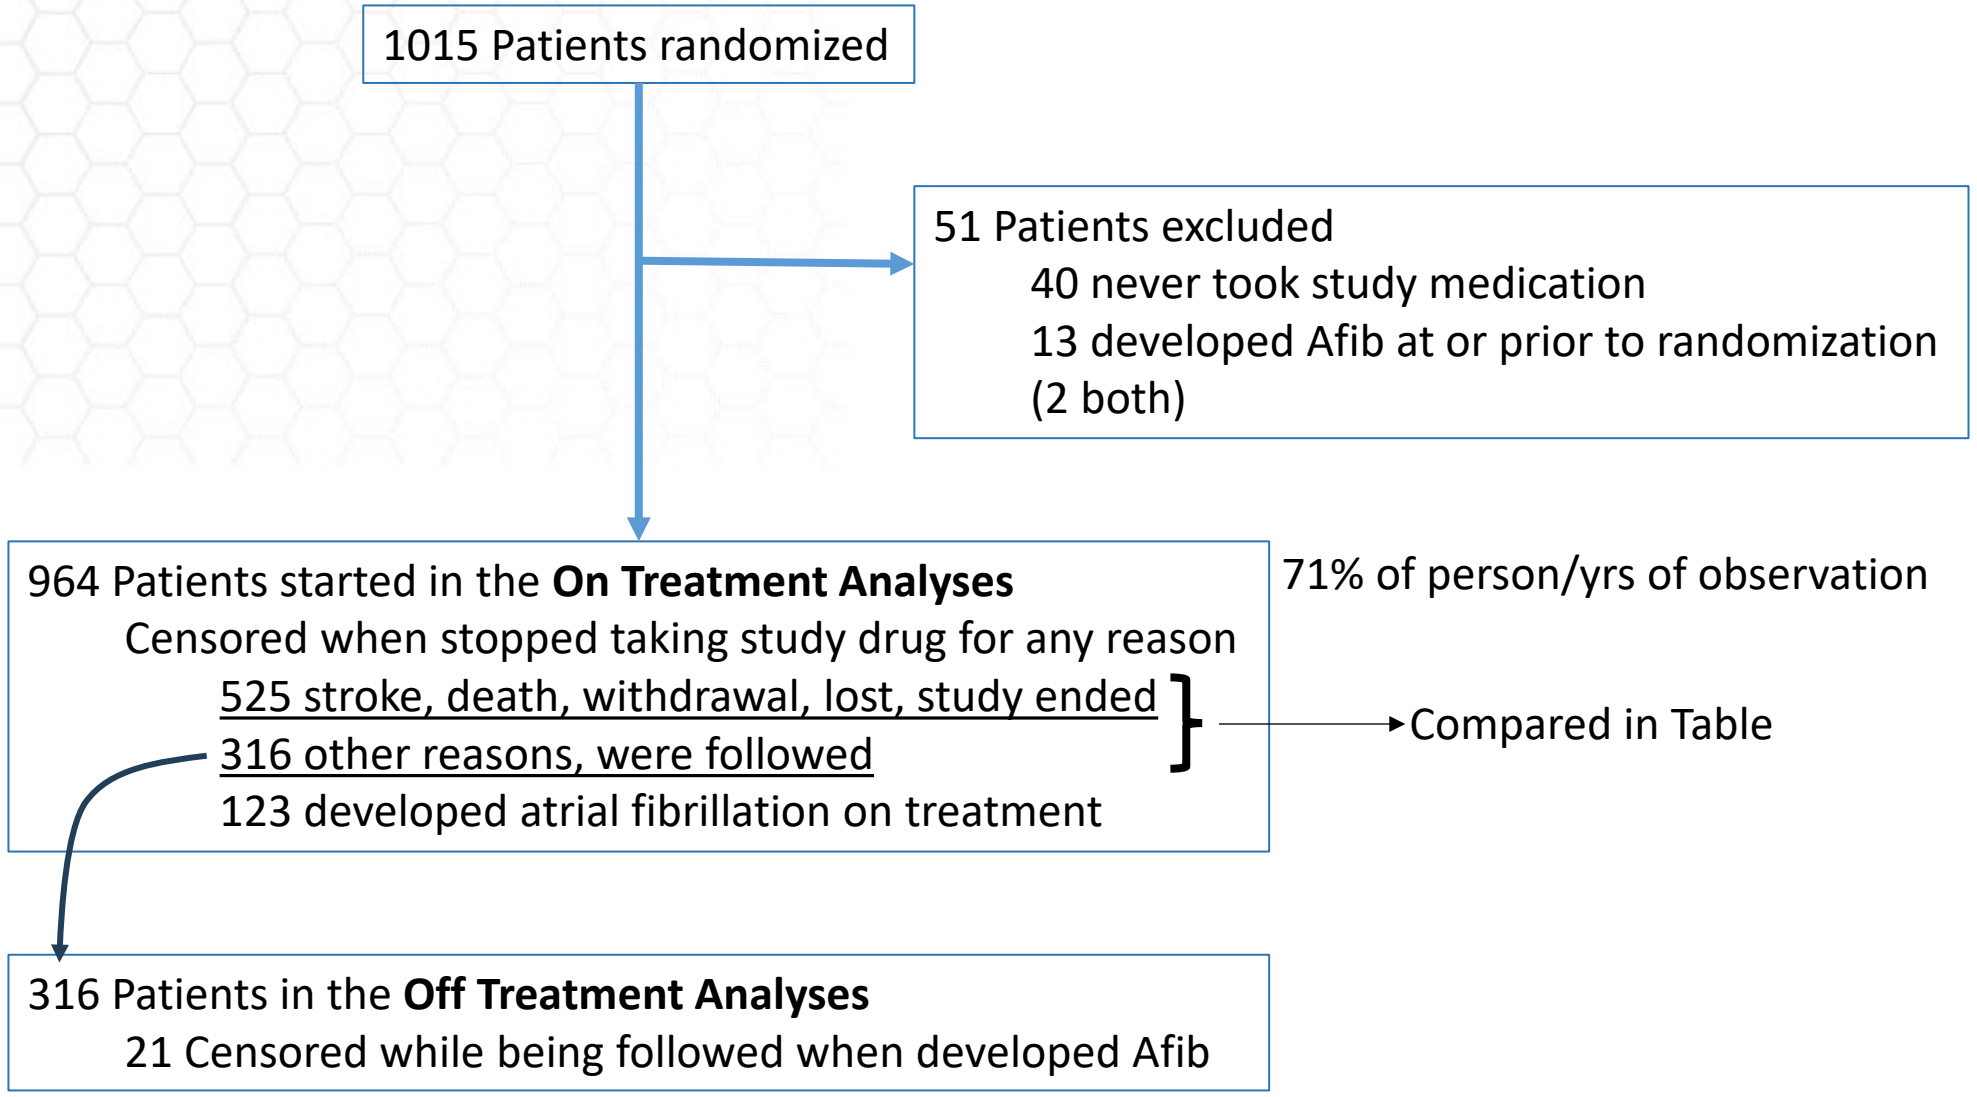
Intention to Treat (ITT) vs. On Treatment

- On Treatment ~= “per protocol” (PP)
- In a perfect trial, these are the same; the hypothesis is the effect of the treatment on outcomes, presumes patients take the treatment
- Begin to diverge when adherence to intervention decreases
  - Likely more relevant in trials with prolonged interventions
- ITT may give a smaller estimate of true effect, but better generalizability
  - On treatment effect may be more relevant to individual patient decision
  - Positive trial result may effect/increase adherence in clinical practice, thus making the ITT effect inaccurate
- On treatment estimates vulnerable to post randomization selection bias and confounding; may require adjustment

NEJM 2017. 377;14: 1391-1398

NIH StrokeNet
PREVENTION | TREATMENT | RECOVERY

On Treatment Population



Analyses

- On treatment group
  - censored at time of Afib or when stopped study medication for any reason
- Off treatment group
  - Enter when study treatment stopped, censored at time of Afib, reached end point or study ended
- Additional analyses
  - Adherence
  - Subgroup analyses
- Cox models for HRs, interaction testing

Table 1. Demographics, patients **Never Followed Off Study Drug** vs. **Followed Off Study Drug**

Patient Characteristic	Never Followed Off Study Drug (N = 525)	Off Study Drug Followed (N = 316)	P value
Aspirin/Apixaban	269/256	160/156	.86
Age (yrs), mean (SD)	67 (11)	67 (11)	.95
Gender, N (% Female)	278 (53%)	176 (56%)	.41
Race, N (%)			
Asian	9 (1.7%)	7 (2.3%)	
Black	98 (19%)	81 (26%)	.08
White	401 (78%)	221 (71%)	
Other	7 (1.4%)	2 (.64%)	
Medical History N (%)			
TIA/Stroke	99 (19%)	67 (21%)	.4
Heart Failure	**24 (4.6%)**	**34 (11%)**	**<.001**
Ischemic Heart Disease	52 (10%)	31 (9.9%)	.98
Hypertension	399 (76%)	251 (80%)	.25
Diabetes	**142 (27%)**	**118 (37%)**	**.0019**
Smoker	219 (42%)	142 (45%)	.34
Weight (kg), mean (SD)	85 (20)	84 (21)	.54
SBP (mm Hg), mean (SD)	134 (18)	137 (19)	.082
Baseline NIHSS, median (IQR)	1 (0-3)	1 (0-3)	.75
Baseline mRS, median (IQR)	1 (0-2)	1 (0-2)	.42
Atrial Cardiopathy Biomarkers			
NT-proBNP, median (IQR)	**488 (864)**	**689 (1512)**	**.015**
PWTFV1, median (IQR)	4915 (2593)	4803 (2872)	.56
LADI, median (IQR)	1.9 (.34)	1.9 (.38)	.4

Main On Treatment Survival Analysis (1289 pyrs)

Table. Efficacy outcomes while patients were on study drug with censoring when atrial fibrillation first detected

Outcome	*number (rate per person years)* Aspirin Group (N = 488)	Apixaban Group (N = 476)	Hazard Ratio (95% CI)
On Study Drug			
Primary Outcome: Recurrent stroke of any type	32 (0.050)	23 (0.036)	0.73 (0.43, 1.25)
Components of primary efficacy outcome			
Ischemic stroke	30 (0.046)	22 (0.034)	0.74 (0.43, 1.29)
Hemorrhagic stroke	2 (0.003)	0 (0.000)	
Stroke of undetermined type	0	1 (0.001)	
Secondary efficacy outcomes			
Recurrent ischemic stroke or systemic embolism	30 (0.046)	22 (0.034)	0.74 (0.43, 1.29)
Recurrent stroke of any type or death from any cause	35 (0.054)	28 (0.044)	0.81 (0.49,1.34)

treatment = Apixaban

Adherence On Treatment

- Data difficult to work with, contain errors
- Good/poor adherence = 90-110% of pills taken/<90%
  - 206 cases dropped due to values >110%

Group	HR (95% CI)	Interaction P value
Good adherence	0.56 (0.25 – 1.3)	0.046
Poor adherence	5.6 (0.67 – 46.2)	

- Small N in poor adherence group
- Hypothesis: Aspirin half life longer, so poor adherence retains protection better

Subgroup	HR	95% CI lower/	upper	Interaction P value
All Patients	0.73	0.42	1.25	
Age, yrs				
<75	0.68	0.35	1.34	0.6
≥75	0.96	0.37	2.5	
Sex				
Male	0.41	0.18	0.93	0.044
Female	1.32	0.6	2.92	
Race

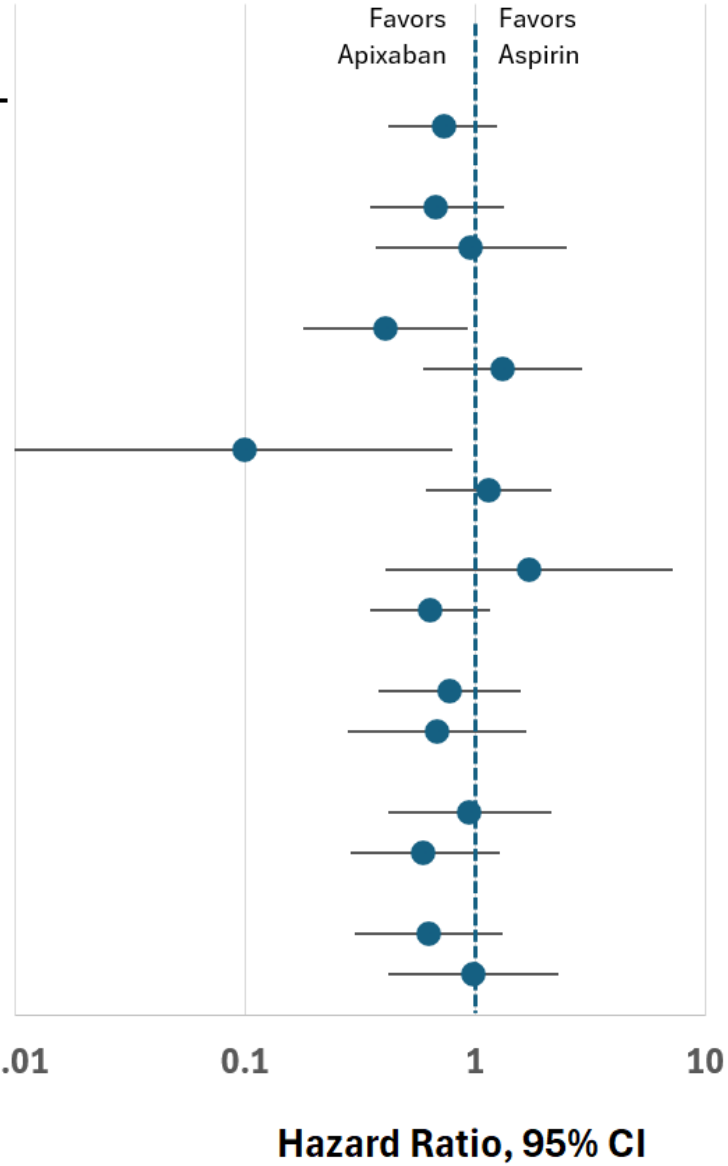
Weight, kg				
<70	1.73	0.41	7.25	0.21
≥70	0.64	0.35	1.17	
NT-proBNP level, pg/mL				
Below median (<304)	0.78	0.38	1.58	0.81
Above median (≥304)	0.69	0.28	1.67	
PTFV1, μV × ms				
Below median (<5200)	0.95	0.42	2.16	0.42
Above median (≥5200)	0.6	0.29	1.28	
Left atrial diameter index, cm/m2				
Below median (<1.89)	0.63	0.3	1.32	0.46
Above median (≥1.89)	0.98	0.42	2.31	



Summary

- 71%/29% of observed person years On/Off Treatment
- On Treatment
  - HR suggests possible benefit, underpowered
  - Proportional Hazards assumption violation: effect varies over time
- Off Treatment
  - Increased rate in apixaban group: previously protective?
- Adherence: better lowers HR
- Subgroups: sex

Discussion points…

- Many hypotheses generated, all exploratory
- ITT v PP/on treatment, explanatory vs pragmatic, efficacy vs effectiveness
  - Both approaches have value, and should be considered for reporting
  - ITT: generalizable, industry std, but may be biased if much lack of adherence
  - OT: more directly tests hypothesis, less generalizable, may need adjustment
- Even stronger focus on adherence
  - Pandemic – did us no favors
  - How much Off Treatment is acceptable?
- Should PP/On Treatment analysis be part of standard SAP, DSMB monitoring?
  - Especially relevant if no safety issues?
- Better markers of atrial cardiopathy needed?
- Is the development of Afib a special censoring event?
  - How to deal with a loss of equipoise for some patients during trial
- How to move forward…

Thank you

Overview

Study population

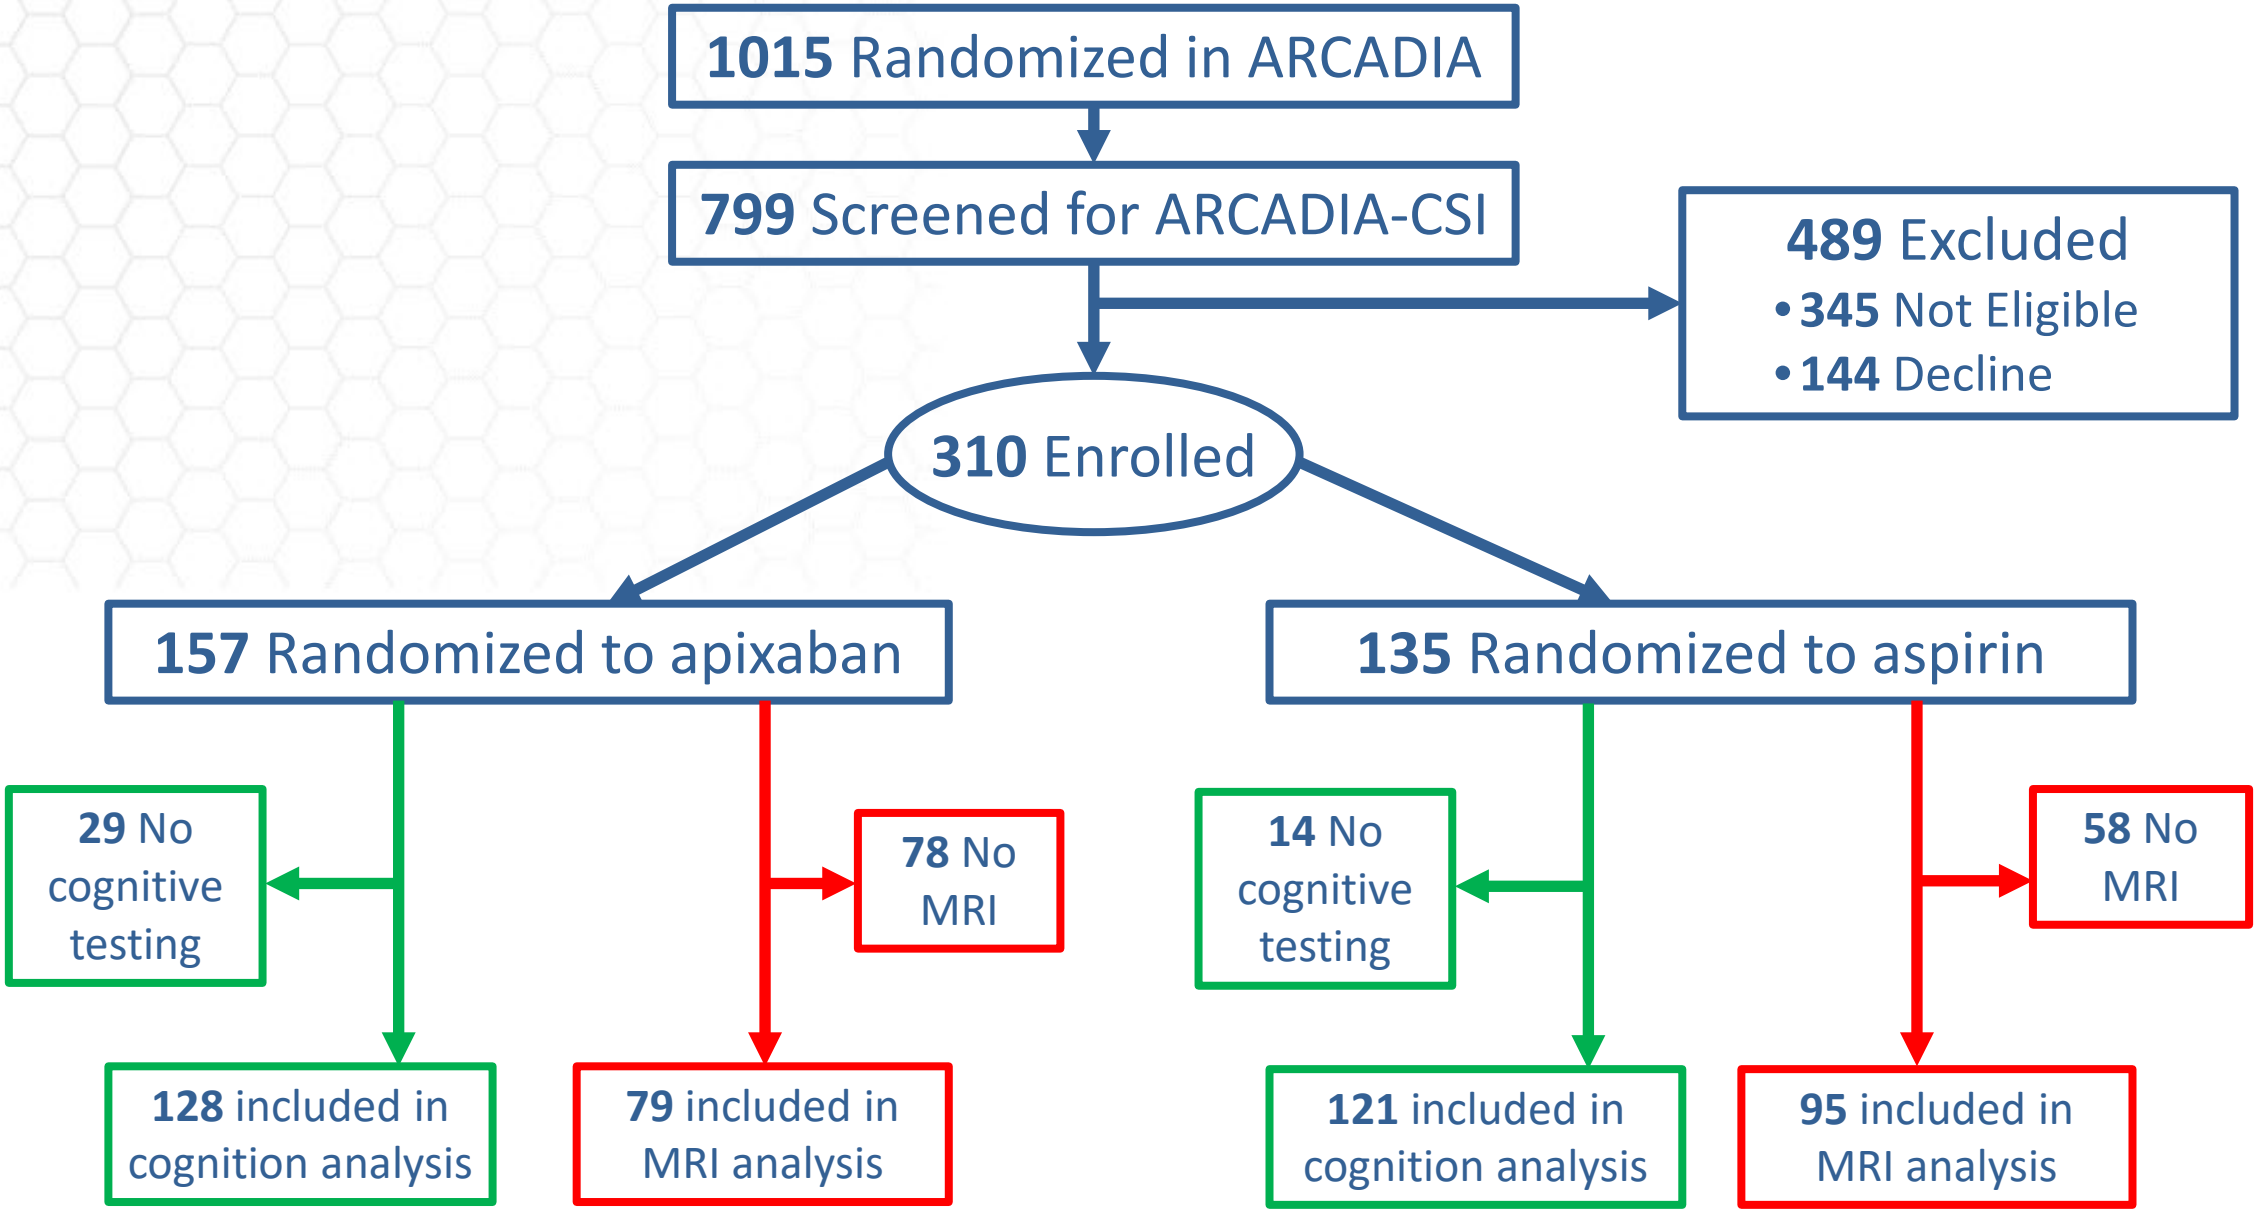
Inclusion and Exclusion

Inclusion Criteria

- Randomized in ARCADIA
- Able to undergo MRI
- Able to provide informed consent

Exclusion Criteria

- ARCADIA study drug permanently discontinued
- Diagnosis of dementia
- Active illicit drug use
- Admission for depression
- <8 years of education
- TBI with >30 min loc



1015 Randomized in ARCADIA
799 Screened for ARCADIA-CSI
489 Excluded
• 345 Not Eligible
• 144 Decline
310 Enrolled
157 Randomized to apixaban
135 Randomized to aspirin
29 No cognitive testing
78 No MRI
14 No cognitive testing
58 No MRI
128 included in cognition analysis
79 included in MRI analysis
121 included in cognition analysis
95 included in MRI analysis

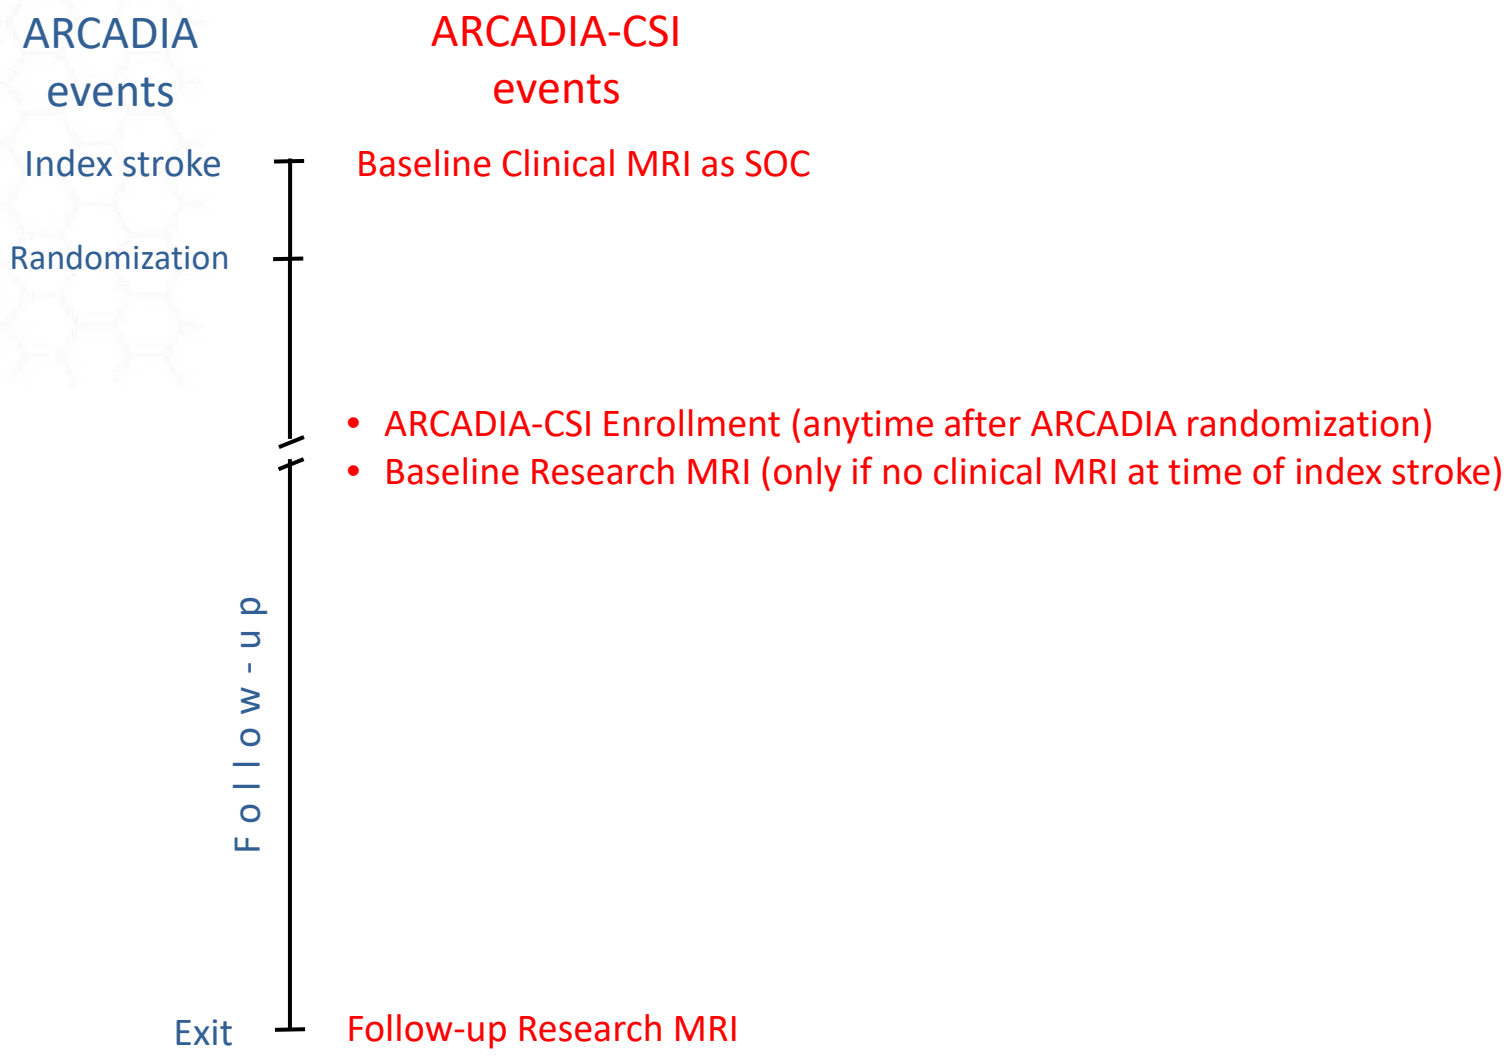
Part 1

ARCADIA-MRI

Background

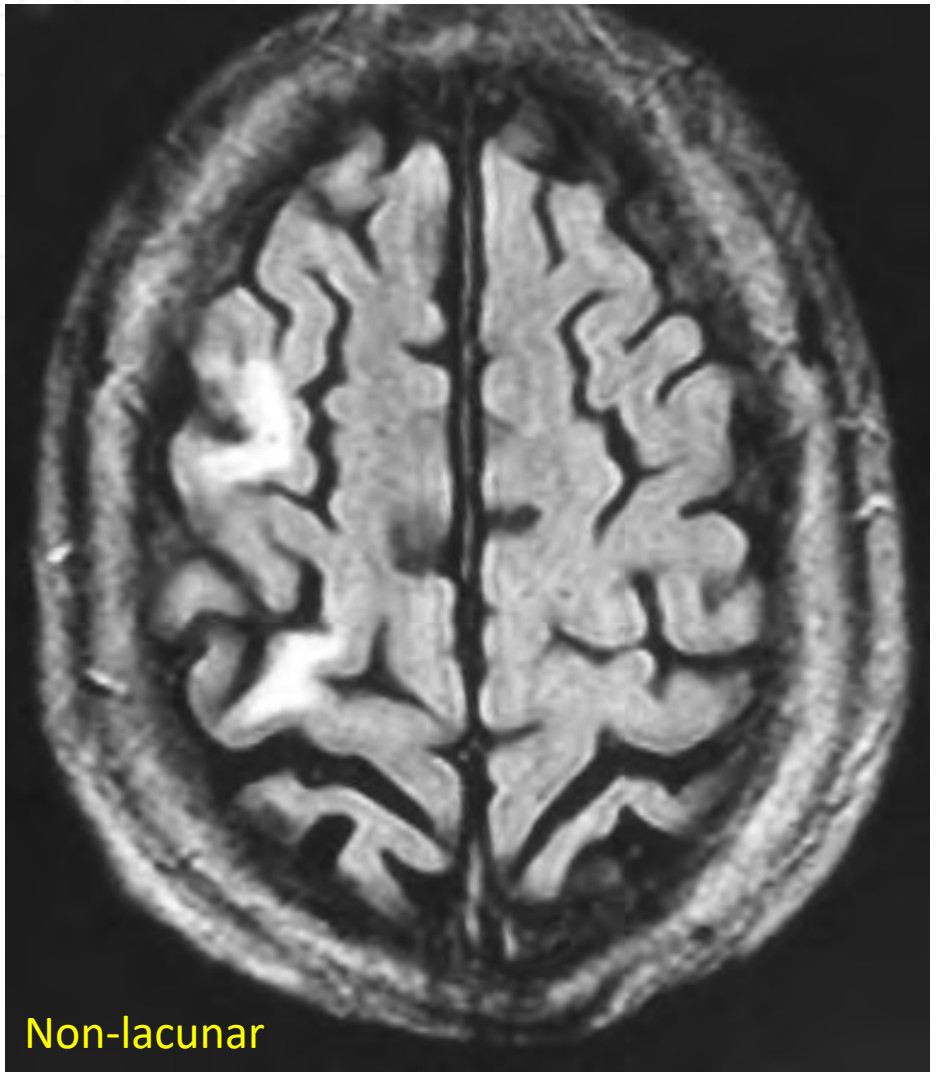
- Covert infarcts are common
  - Prevalence 30-50%
  - Incidence up to 19% annually after TIA
- Covert infarcts are important
  - Associated with increased risk of cognitive impairment and dementia
  - Associated with increased risk of clinical stroke
- Two secondary stroke prevention studies have focused on covert infarcts
  - NAVIGATE-ESUS and PACIFIC-Stroke
  - Annual rate of covert infarcts 10-22%

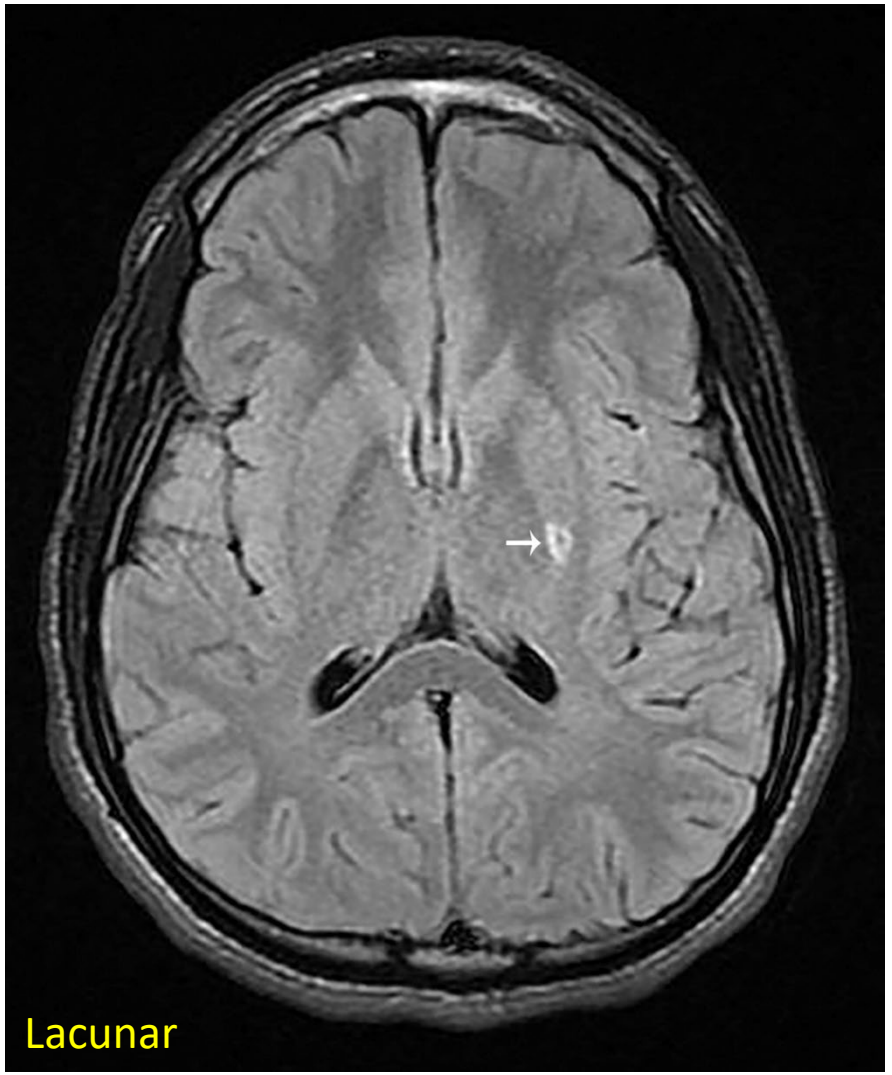
Timing of MRI Scans



MRI Interpretation

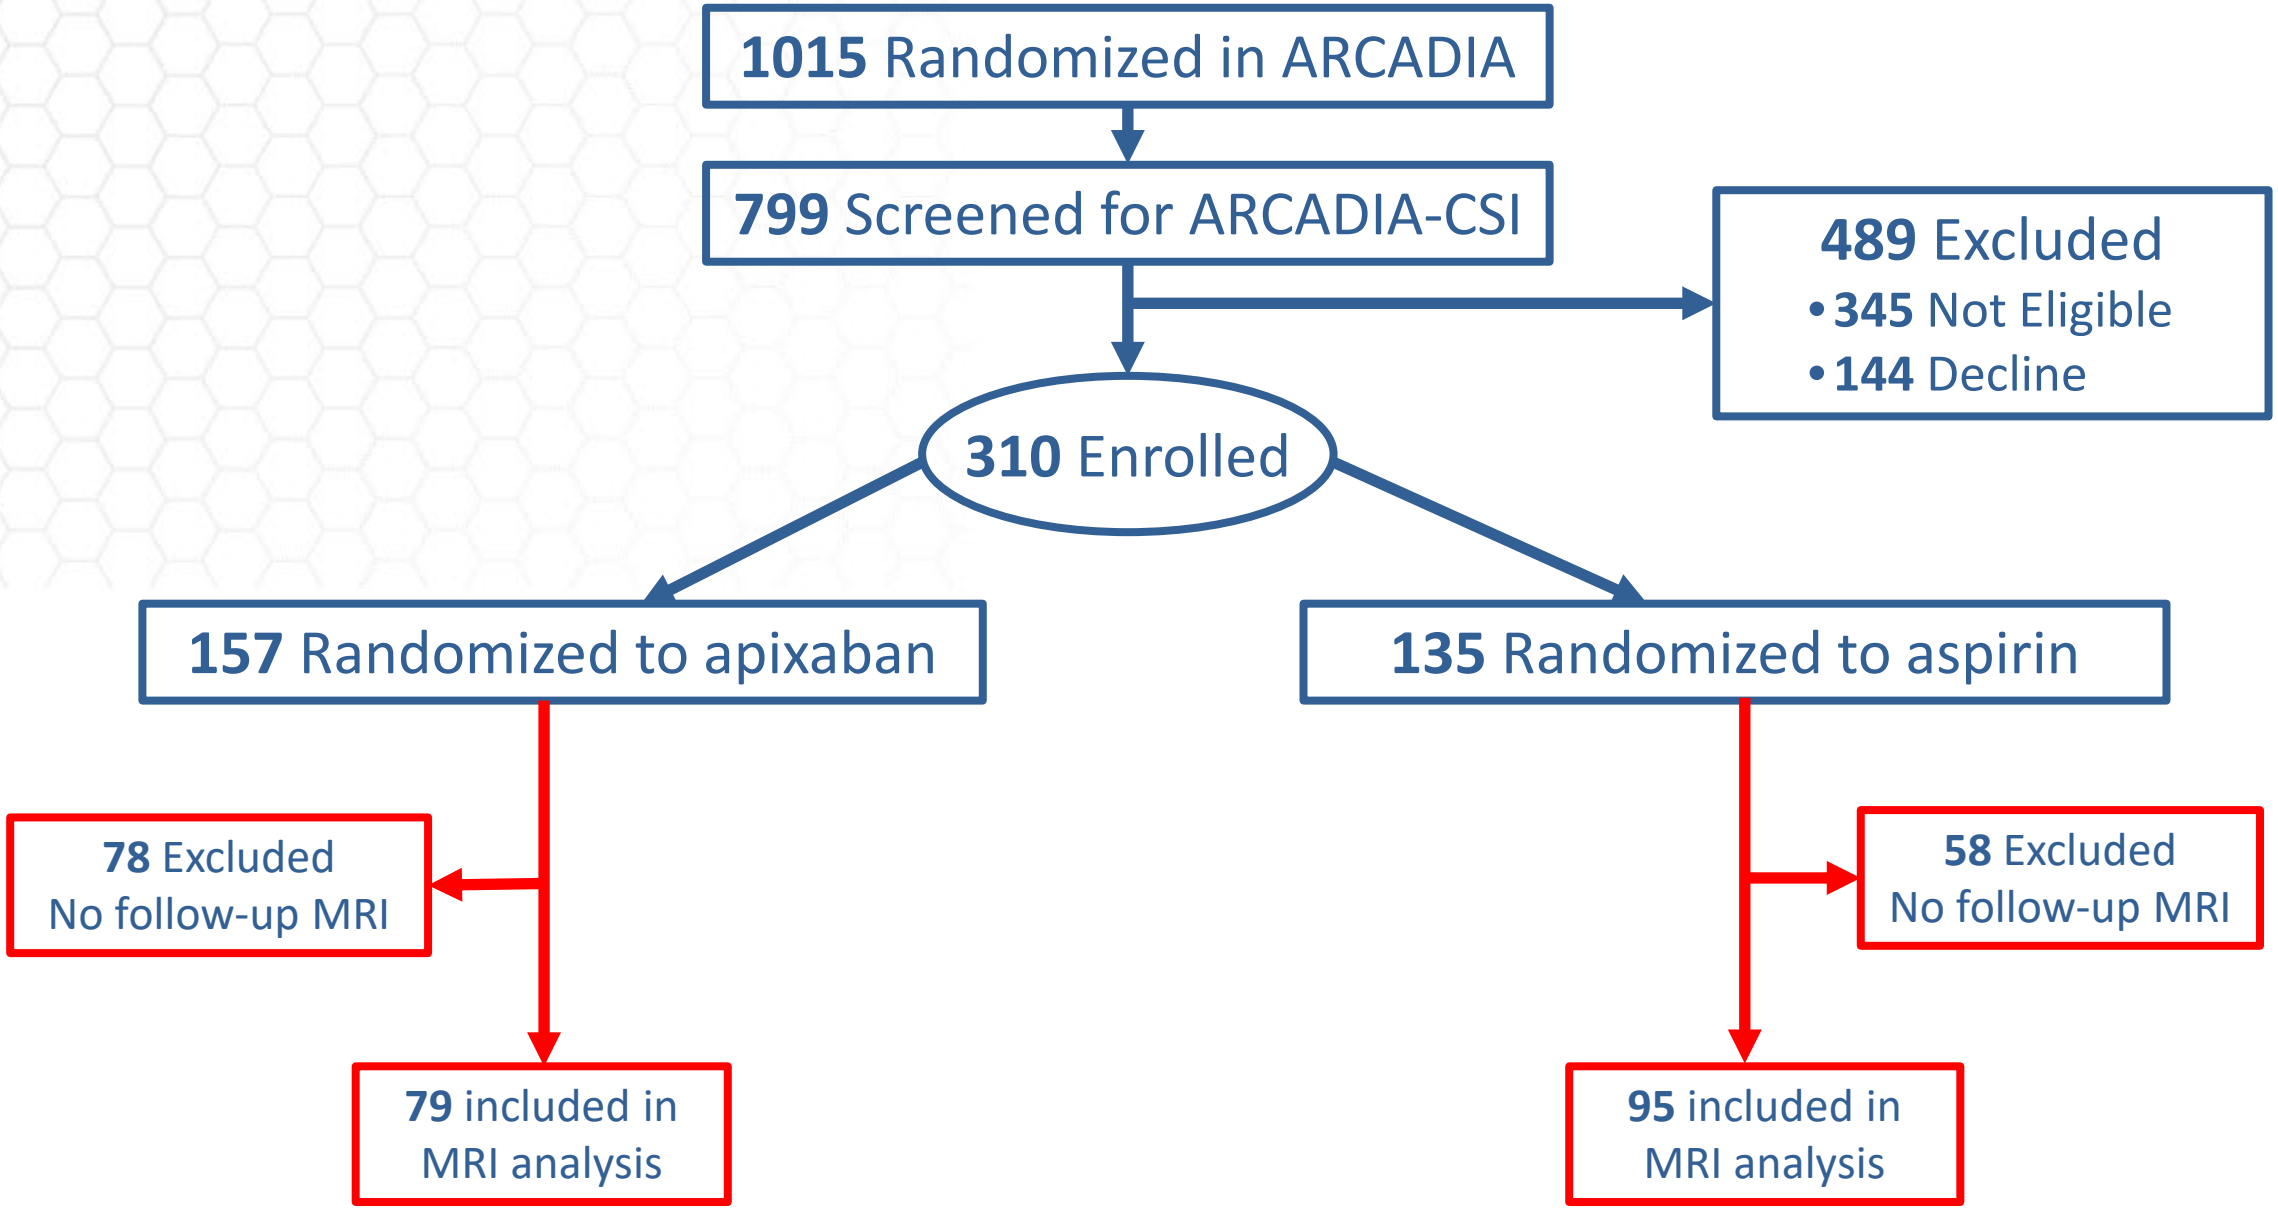
- Follow-up scans rated for the presence of new silent infarcts
- Lacunar infarcts defined as round or ovoid subcortical lesions <15 mm in diameter





Statistical Analysis

- The relative risk of the incidence of one or more new non-lacunar covert infarcts during follow-up was estimated using Poisson regression with adjustment for follow-up time and inverse probability weighting to account for missing follow-up MRI studies



1015 Randomized in ARCADIA
799 Screened for ARCADIA-CSI

Primary Outcome	Apixaban (n=79)	Aspirin (n=95)	RR (95% CI)	P-value
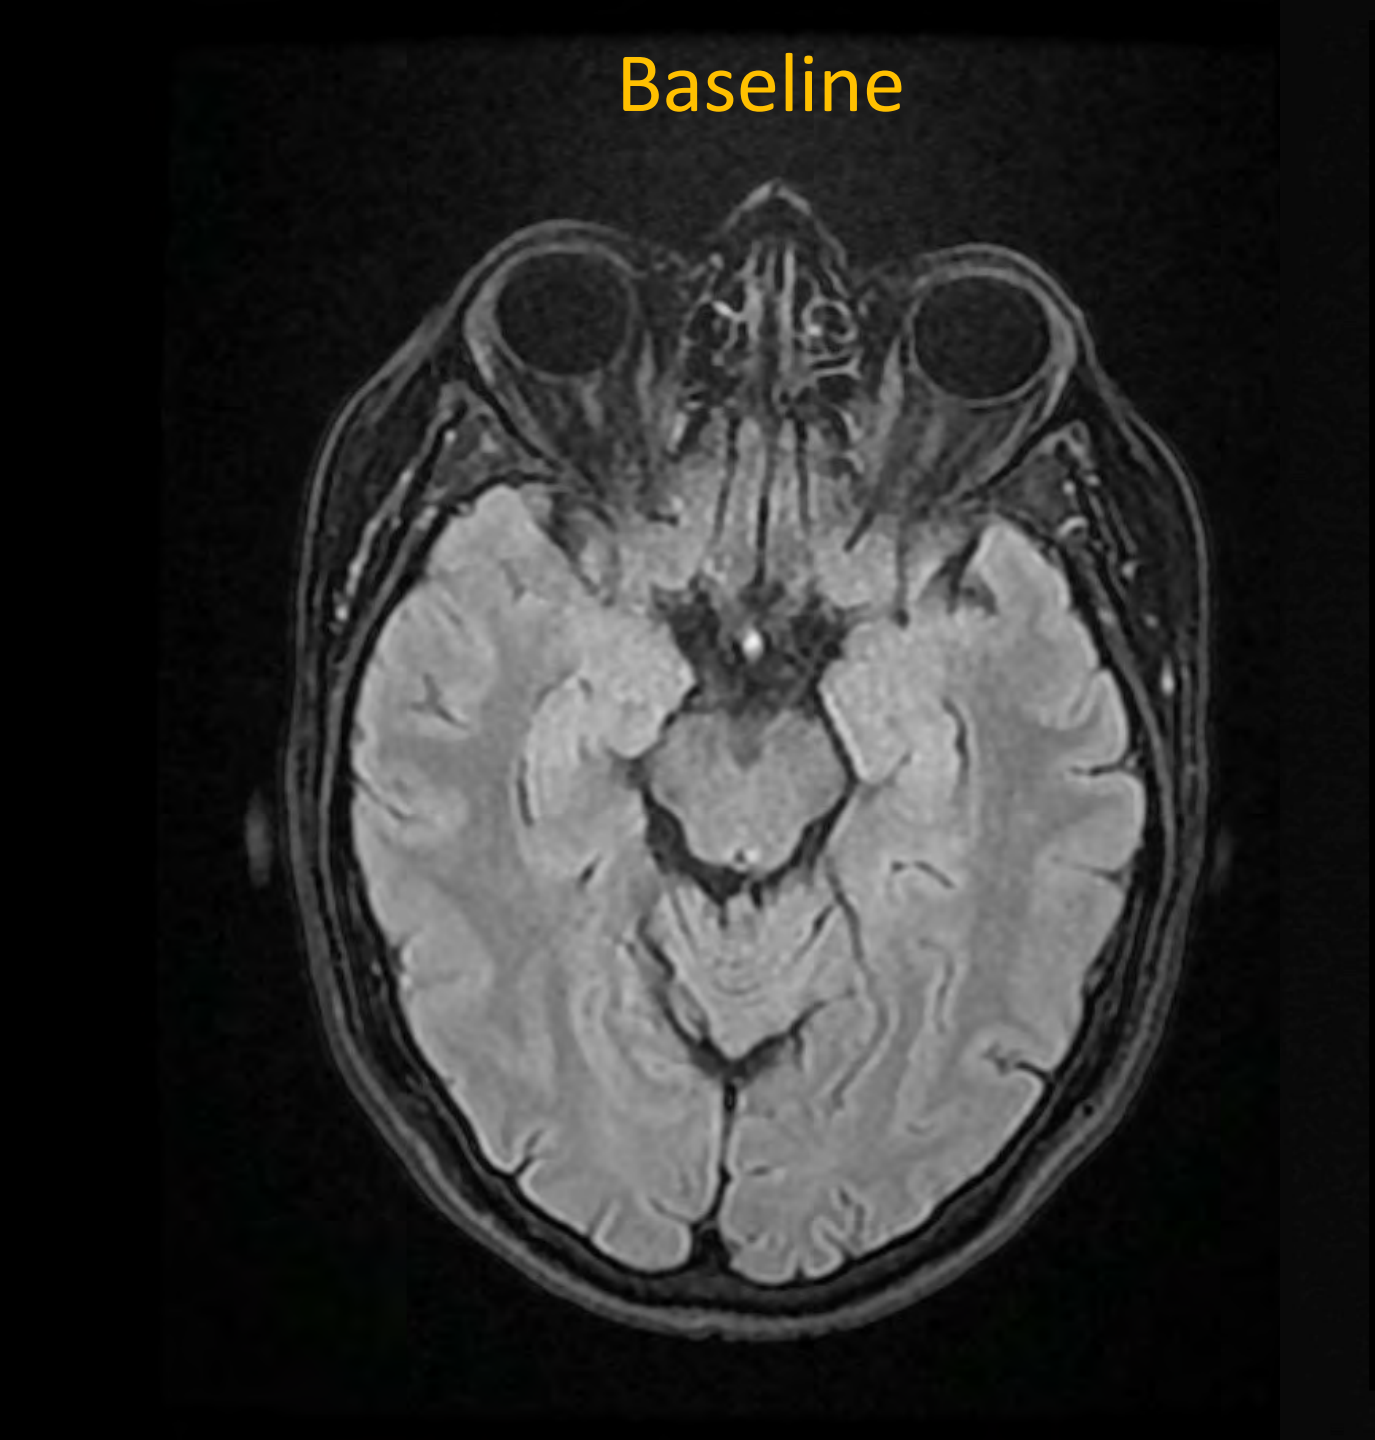
≥1 non-lacunar covert infarct	4 (5%)	17 (18%)		

Primary Analysis

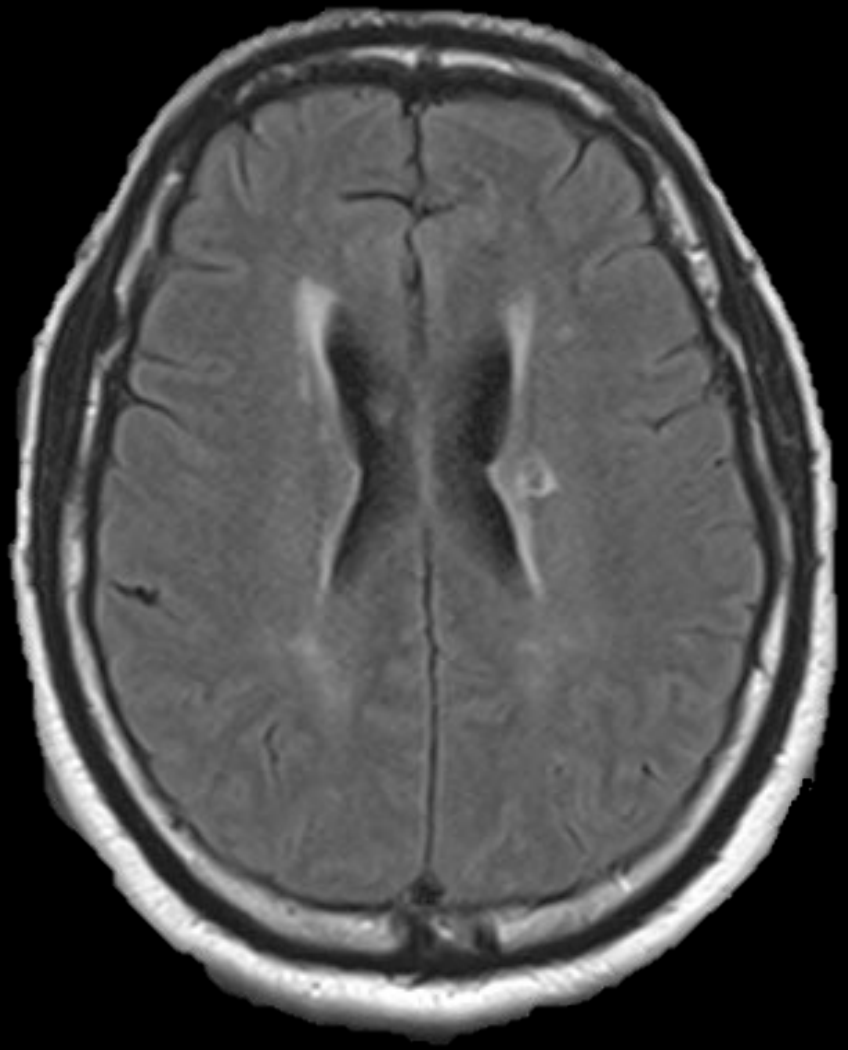
Difference in non-lacunar covert infarcts between treatment arms

Primary Outcome	Apixaban (n=79)	Aspirin (n=95)	RR (95% CI)	P-value
≥1 non-lacunar covert infarct	4 (5%)	17 (18%)	0.29 (0.10 – 0.83)	0.02

Baseline



Baseline



Secondary Outcome

Composite of ≥1 non-lacunar covert infarct or a non-lacunar clinical stroke

Outcome	Apixaban (n=79)	Aspirin (n=95)	RR (95% CI)	P-value
≥1 non-lacunar covert infarct	4 (5%)	17 (18%)	0.29 (0.10 – 0.83)	0.02
≥1 non-lacunar covert infarct or a non-lacunar clinical stroke	7 (9%)	25 (26%)	0.36 (0.17 – 0.79)	0.01

Additional Outcomes

Outcome	Apixaban (n=79)	Aspirin (n=95)	RR (95% CI)	P-value
≥1 non-lacunar covert infarct	4 (5%)	17 (18%)	0.29 (0.10 – 0.83)	0.02
≥1 non-lacunar covert infarct or a non-lacunar clinical stroke	7 (9%)	25 (26%)	0.36 (0.17 – 0.79)	0.01
Additional Outcomes				
Non-lacunar clinical stroke	3 (4%)	8 (8%)	0.52 (0.15 – 1.77)	0.30

Additional Outcomes

Outcome	Apixaban (n=79)	Aspirin (n=95)	RR (95% CI)	P-value
≥1 non-lacunar covert infarct	4 (5%)	17 (18%)	0.29 (0.10 – 0.83)	0.02
≥1 non-lacunar covert infarct or a non-lacunar clinical stroke	7 (9%)	25 (26%)	0.36 (0.17 – 0.79)	0.01
Additional Outcomes				
Non-lacunar clinical stroke	3 (4%)	8 (8%)	0.52 (0.15 – 1.77)	0.30
≥1 lacunar covert infarct	8 (10%)	12 (13%)	0.80 (0.34 – 1.86)	0.60

Additional Outcomes

Outcome	Apixaban (n=79)	Aspirin (n=95)	RR (95% CI)	P-value
≥1 non-lacunar covert infarct	4 (5%)	17 (18%)	0.29 (0.10 – 0.83)	0.02
≥1 non-lacunar covert infarct or a non-lacunar clinical stroke	7 (9%)	25 (26%)	0.36 (0.17 – 0.79)	0.01
Additional Outcomes				
Non-lacunar clinical stroke	3 (4%)	8 (8%)	0.52 (0.15 – 1.77)	0.30
≥1 lacunar covert infarct	8 (10%)	12 (13%)	0.80 (0.34 – 1.86)	0.60
≥1 lacunar or non-lacunar covert infarct	12 (15%)	25 (26%)	0.57 (0.31 – 1.07)	0.08

Limitations / Discussion

- High percentage (44%) of enrolled patients did not return for their follow-up MRI
- Patients included in the ARCADIA-MRI analysis were less likely to discontinue study drug prematurely (15.5%) than patients who were screened but not enrolled (50.8%)

Conclusion

Among patients with a cryptogenic stroke and atrial cardiopathy, apixaban as compared to aspirin:

- prevents non-lacunar covert infarcts
- does not prevent lacunar covert infarcts

Part 2

ARCADIA-Cognition

ARCADIA – CSI: (Cognition Substudy)

Cognition and Covert Infarction

Vermeer SE et al. Prevalence and risk factors of silent brain infarcts in the population-based Rotterdam Scan Study. Stroke. Jan 2002;33(1):21-5.

Vermeer SE, Longstreth WT, Jr., Koudstaal PJ. Silent brain infarcts: a systematic review. Lancet Neurol. Jul 2007;6(7):611-9. doi:10.1016/S1474-4422(07)70170-9

Iatrogenic Etiology: CABG (Tachibana, 2021), TAVR (Lazar, 2018), AF Ablation (Hahne, 2016)

Specific Aim 2: Determine the effect of apixaban (vs aspirin) on the longitudinal rate of change (i.e., slope) of global cognitive function after stroke (primary clinical outcome).

Atrial cardiopathy biomarkers and atrial fibrillation in the ARCADIA trial

Hooman Kamel[1], Mitchell SV Elkind[2,3], Richard A Kronmal[4], WT Longstreth, Jr.[5,6,7], Pamela Plummer[8], Rebeca Aragon Garcia[2], Joseph P Broderick[8], Qi Pauls[9], Jordan J Elm[9], Fadi Nahab[10], L Scott Janis[11], Marco R Di Tullio[12], Elsayed Z Soliman[13], Jeff S Healey[14] and David L Tirschwell[5]; for the ARCADIA Investigators

NIH StrokeNet
PREVENTION | TREATMENT | RECOVERY

Table 1. Characteristics of patients screened for atrial cardiopathy in ARCADIA, stratified by subsequent detection of AF.

Characteristic[a]	Atrial fibrillation (*N* = 254)	No atrial fibrillation (*N* = 3491)
Age, mean (SD), years	71.7 (9.7)	65.8 (10.6)
Female, no. (%)	134 (52.8%)	1604 (45.9%)
Race, no. (%) [*N* = 3659][b]		
Asian	2 (0.8%)	68 (2.0%)
Black or African American	43 (17.1%)	649 (19.0%)
Other	205 (81.7%)	2645 (77.6%)
White	1 (0.4%)	46 (1.3%)
Ethnicity, no. (%) [*N* = 3724][b]		
Hispanic or Latino	15 (6.0%)	343 (9.9%)
Not Hispanic or Latino	237 (94.0%)	3129 (90.1%)
Medical comorbidities		
Hypertension	200 (78.7%)	2512 (72.0%)
Prior or current tobacco use	104 (40.9%)	1426 (40.8%)
Diabetes	76 (29.9%)	1052 (30.1%)
Coronary artery disease	26 (10.2%)	265 (7.6%)
Heart failure	18 (7.1%)	136 (3.9%)
Peripheral artery disease	5 (2.0%)	67 (1.9%)
Atrial cardiopathy biomarkers		
$PTFV_1$, mean (SD), μV*ms [*N* = 3673]	3798 (2,660)	3426 (2,259)
NT-proBNP, median (IQR), pg/mL [*N* = 3580]	416 (258–751)	96 (45–231)
LA diameter index, mean (SD), cm/m^2 [*N* = 3125]	2.1 (0.4)	1.8 (0.4)
Days from stroke to biomarker screening, mean (SD)	1.9 (4.3)	3.0 (25.3)

AF: atrial fibrillation; IQR: interquartile range; LA: left atrial; NT-proBNP: amino terminal pro-B-type natriuretic peptide; $PTFV_1$: P-wave terminal force in lead V_1; SD: standard deviation.

[a]Percentages may not total 100 because of rounding.

[b]Other race was defined as American Indian or Alaska Native, Native Hawaiian or Other Pacific Islander, or more than one race. Site investigators and coordinators were instructed to directly ask participants to report their self-identified race and ethnicity, which were then categorized per NIH guidelines.

Table 2. Associations between baseline atrial cardiopathy biomarkers and subsequent detection of atrial fibrillation in ARCADIA.

Biomarker	Model 1	Model 2	Model 3
$PTFV_1$	1.15 (1.03–1.28)	1.03 (0.92–1.14)	-
NT-proBNP	1.99 (1.85–2.13)	1.83 (1.69–1.97)	1.88 (1.67–2.11)
LADI	1.34 (1.20–1.50)	1.25 (1.14–1.38)	1.25 (1.14–1.37)

LADI: left atrial diameter index; NT-proBNP: amino terminal pro-B-type natriuretic peptide; $PTFV_1$: P-wave terminal force in lead V_1.
Data are presented as risk ratios (95% confidence intervals) per standard-deviation increase in the atrial cardiopathy biomarker variables. Model 1 was unadjusted. Model 2 included all three biomarkers together. Model 3 additionally adjusted for age, sex, race, ethnicity, hypertension, diabetes, coronary artery disease, heart failure, peripheral artery disease, and tobacco use, with variables reduced using stepwise reverse selection with a *p*-value threshold of 0.2.

Table 3. Discrimination of baseline atrial cardiopathy biomarkers for predicting subsequent AF in ARCADIA.

Variables included in predictive model	C-statistic (95% CI)
$PTFV_1$, NT-proBNP, LADI	0.82 (0.79–0.85)
NT-proBNP, LADI	0.82 (0.79–0.85)
NT-proBNP, $LADI_{central}$	0.80 (0.77–0.83)
NT-proBNP, $LAVI_{central}$	0.81 (0.78–0.84)
NT-proBNP, LADI, age	0.82 (0.79–0.85)
NT-proBNP	0.80 (0.77–0.83)
LADI	0.67 (0.63–0.72)
$LADI_{central}$	0.67 (0.64–0.71)
$LAD_{central}$	0.66 (0.63–0.70)
$LAVI_{central}$	0.71 (0.67–0.74)
$PTFV_1$	0.54 (0.50–0.58)
Age	0.66 (0.63–0.70)

Figure 1. Calibration of atrial cardiopathy biomarkers for predicting AF in ARCADIA.

Each open circle represents 1 of 20 groups of ARCADIA trial participants. Patients were grouped by their predicted probability of atrial fibrillation (AF) based on a relative risk regression model comprised of NT-proBNP, left atrial dimension index, and P-wave terminal force in ECG lead V_1. The circle's position on the x-axis represents the group's predicted probability of atrial fibrillation. The circle's position on the y-axis represents the actual proportion of patients in the group who developed atrial fibrillation. The dashed blue line represents perfect calibration

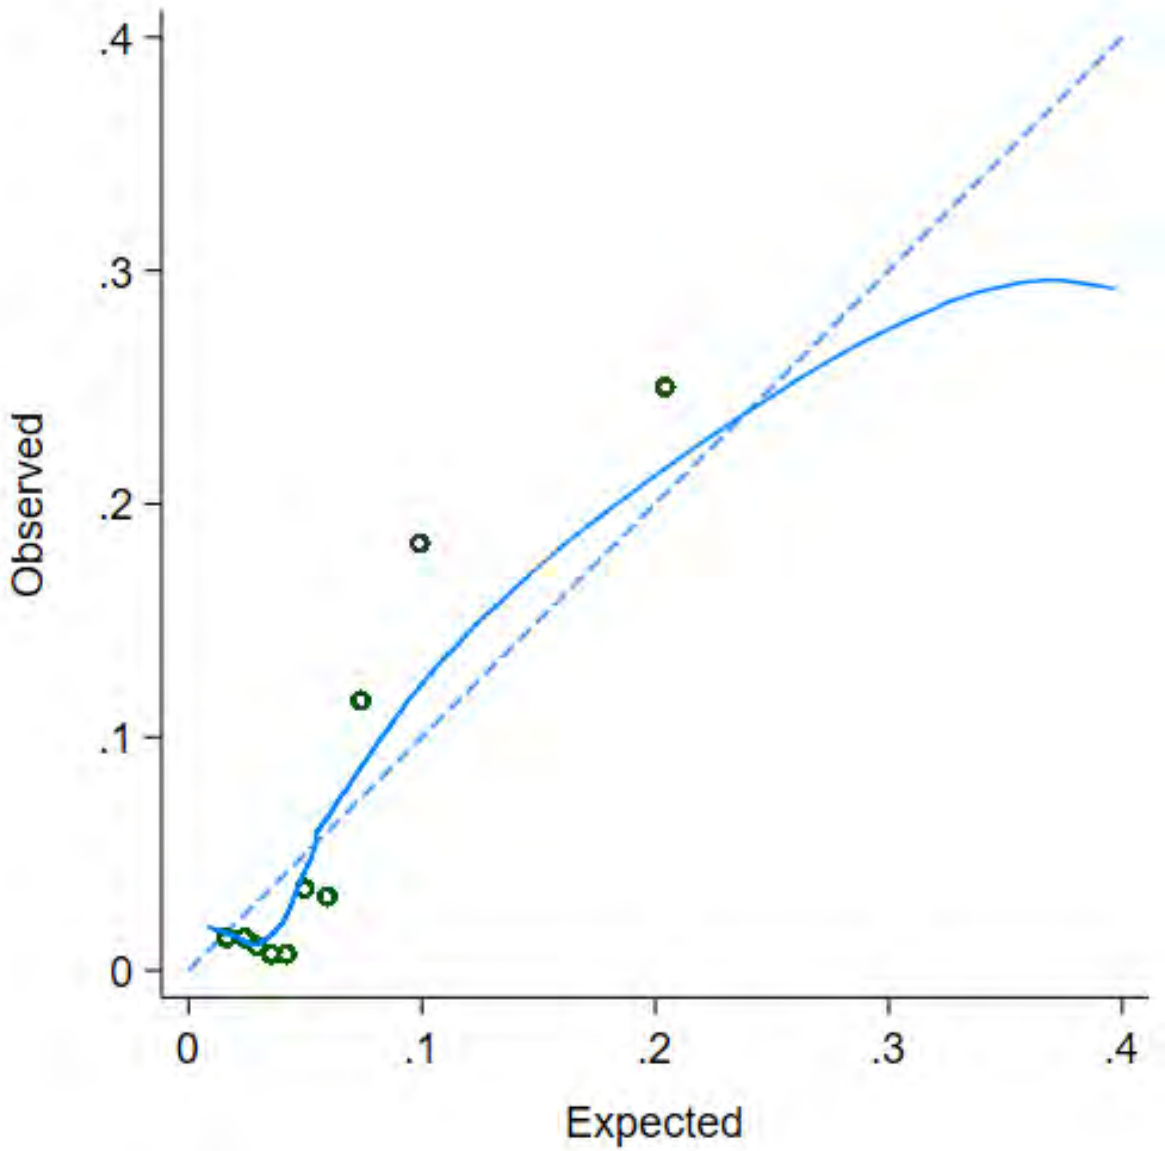

Table 4. Sensitivity analysis of associations between baseline atrial cardiopathy biomarkers and subsequent detection of atrial fibrillation in the ARCADIA trial.

Patient population	$PTFV_1$[a]	NT-proBNP[a]	LADI[a]	Discrimination[b]
Eligible	0.84 (0.74–0.95)	1.30 (1.15–1.47)	1.18 (1.10–1.26)	0.67
Randomized	0.81 (0.68–0.95)	1.38 (1.15–1.66)	1.25 (1.11–1.41)	0.69

LADI: left atrial diameter index; NT-proBNP: amino terminal pro-B-type natriuretic peptide; $PTFV_1$: P-wave terminal force in lead V_1.
[a]Data are presented as risk ratios (95% confidence intervals) or hazard ratios (95% confidence intervals) per standard-deviation increase in the atrial cardiopathy biomarker variables in a model that included all three biomarkers together.
[b]Data are presented as c-statistics or Harrell's C.

Limitations

- Differential ascertainment of AF based on eligibility for randomization
- Heterogeneity in AF monitoring and ascertainment

Conclusions

Biomarkers used to identify atrial cardiopathy in ARCADIA were associated with and predictive of subsequent AF detection, suggesting neutral results of trial not entirely due to suboptimal biomarkers of atrial cardiopathy

Predictive performance of biomarkers was modest, supporting further research to identify other measures that can identify a more severe form of atrial cardiopathy with a high risk of AF

Heart-Rhythm Monitoring Practices, Detection of Atrial Fibrillation, and Effect of Anticoagulation in the ARCADIA Trial

Figure 1. Flow Diagram of Patients Included in Analysis of Heart-Rhythm Monitoring Practices in the ARCADIA Trial.

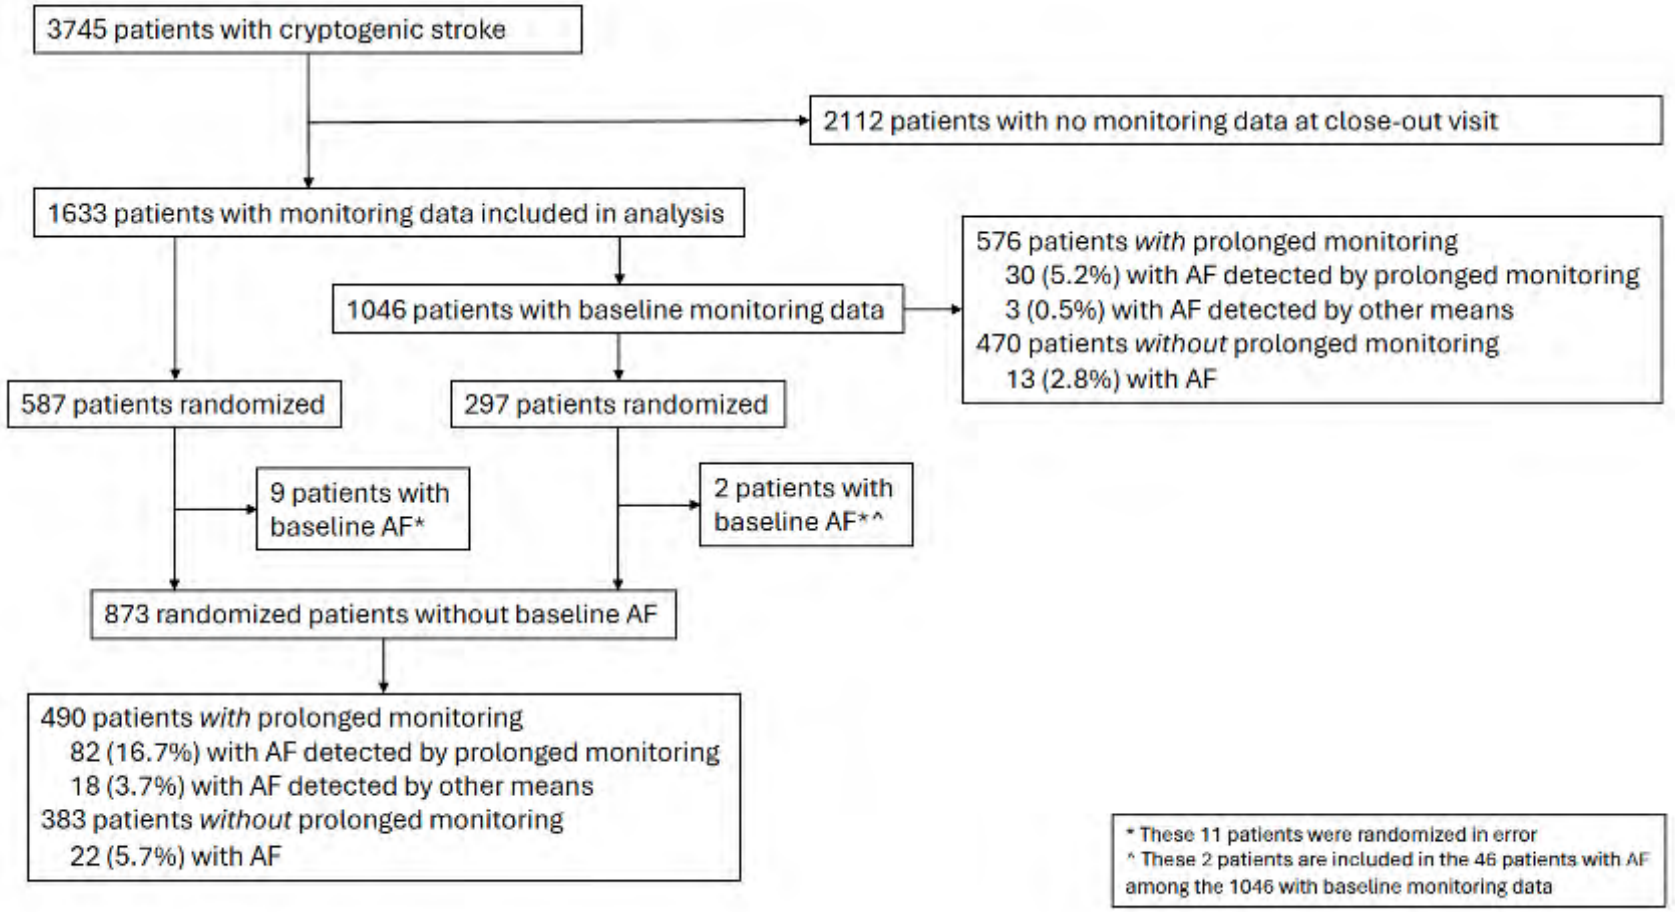

Table 1. Characteristics of patients screened for atrial cardiopathy in ARCADIA, stratified by subsequent detection of AF.

Characteristic[a]	Atrial fibrillation (*N* = 254)	No atrial fibrillation (*N* = 3491)
Age, mean (SD), years	71.7 (9.7)	65.8 (10.6)
Female, no. (%)	134 (52.8%)	1604 (45.9%)

Days from stroke to biomarker screening, mean (SD)	1.9 (4.3)	3.0 (25.3)

AF: atrial fibrillation; IQR: interquartile range; LA: left atrial; NT-proBNP: amino terminal pro-B-type natriuretic peptide; $PTFV_1$: P-wave terminal force in lead V_1; SD: standard deviation.

[a]Percentages may not total 100 because of rounding.

[b]Other race was defined as American Indian or Alaska Native, Native Hawaiian or Other Pacific Islander, or more than one race. Site investigators and coordinators were instructed to directly ask participants to report their self-identified race and ethnicity, which were then categorized per NIH guidelines.

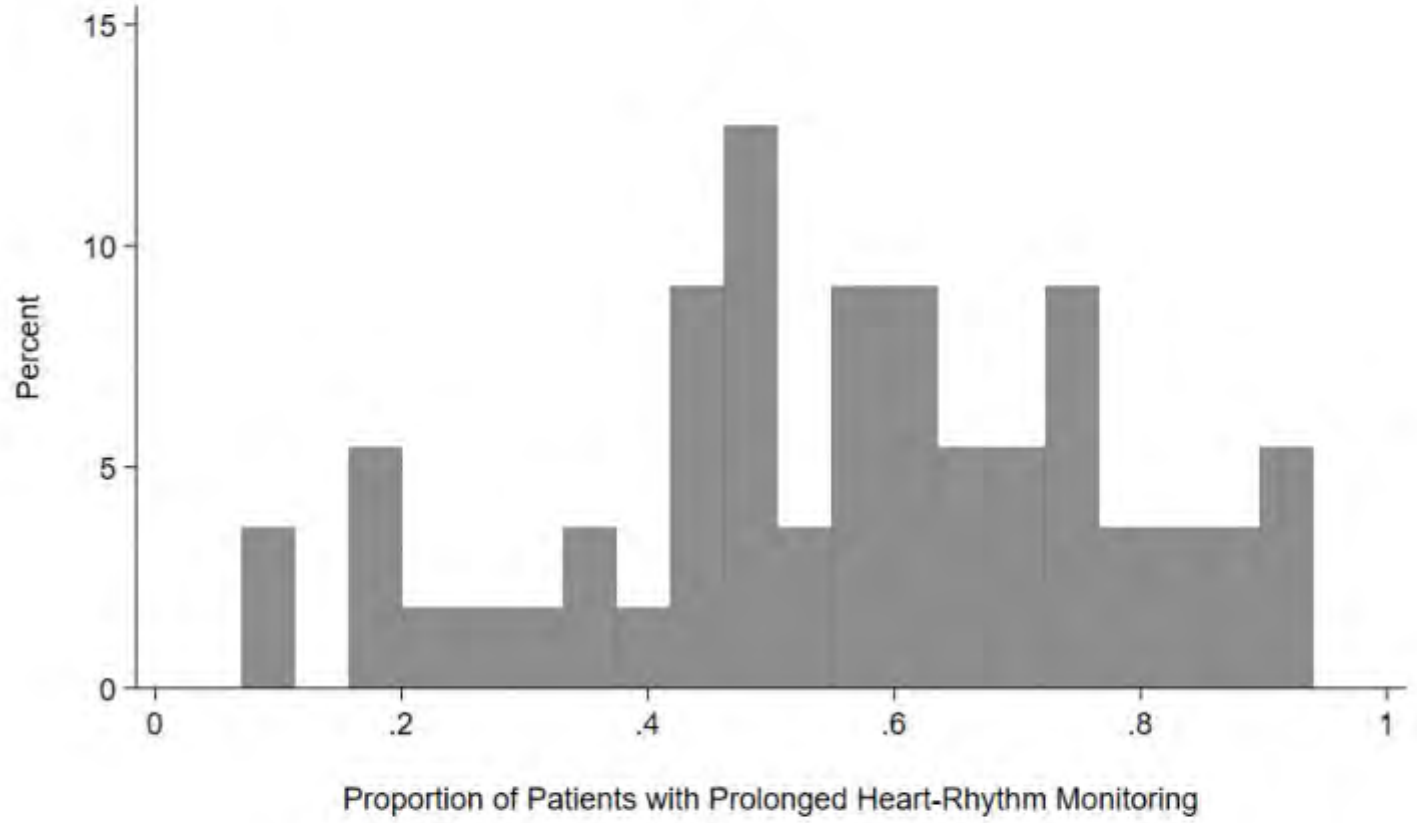
Table 2. Proportions of ARCADIA Patients Undergoing Prolonged Heart-Rhythm Monitoring.[a]

	Any Prolonged Monitoring	External Ambulatory Monitor	Implantable Loop Recorder	Both[b]
Overall (n = 1,633)	58.6%	34.7%	29.3%	5.5%
Before randomization (n = 1,046)	55.1%	39.0%	18.6%	2.6%
After randomization (n = 873)	56.2%	21.7%	39.4%	4.9%

Table 3. Factors Associated with Prolonged Heart-Rhythm Monitoring in the ARCADIA Trial.[a]

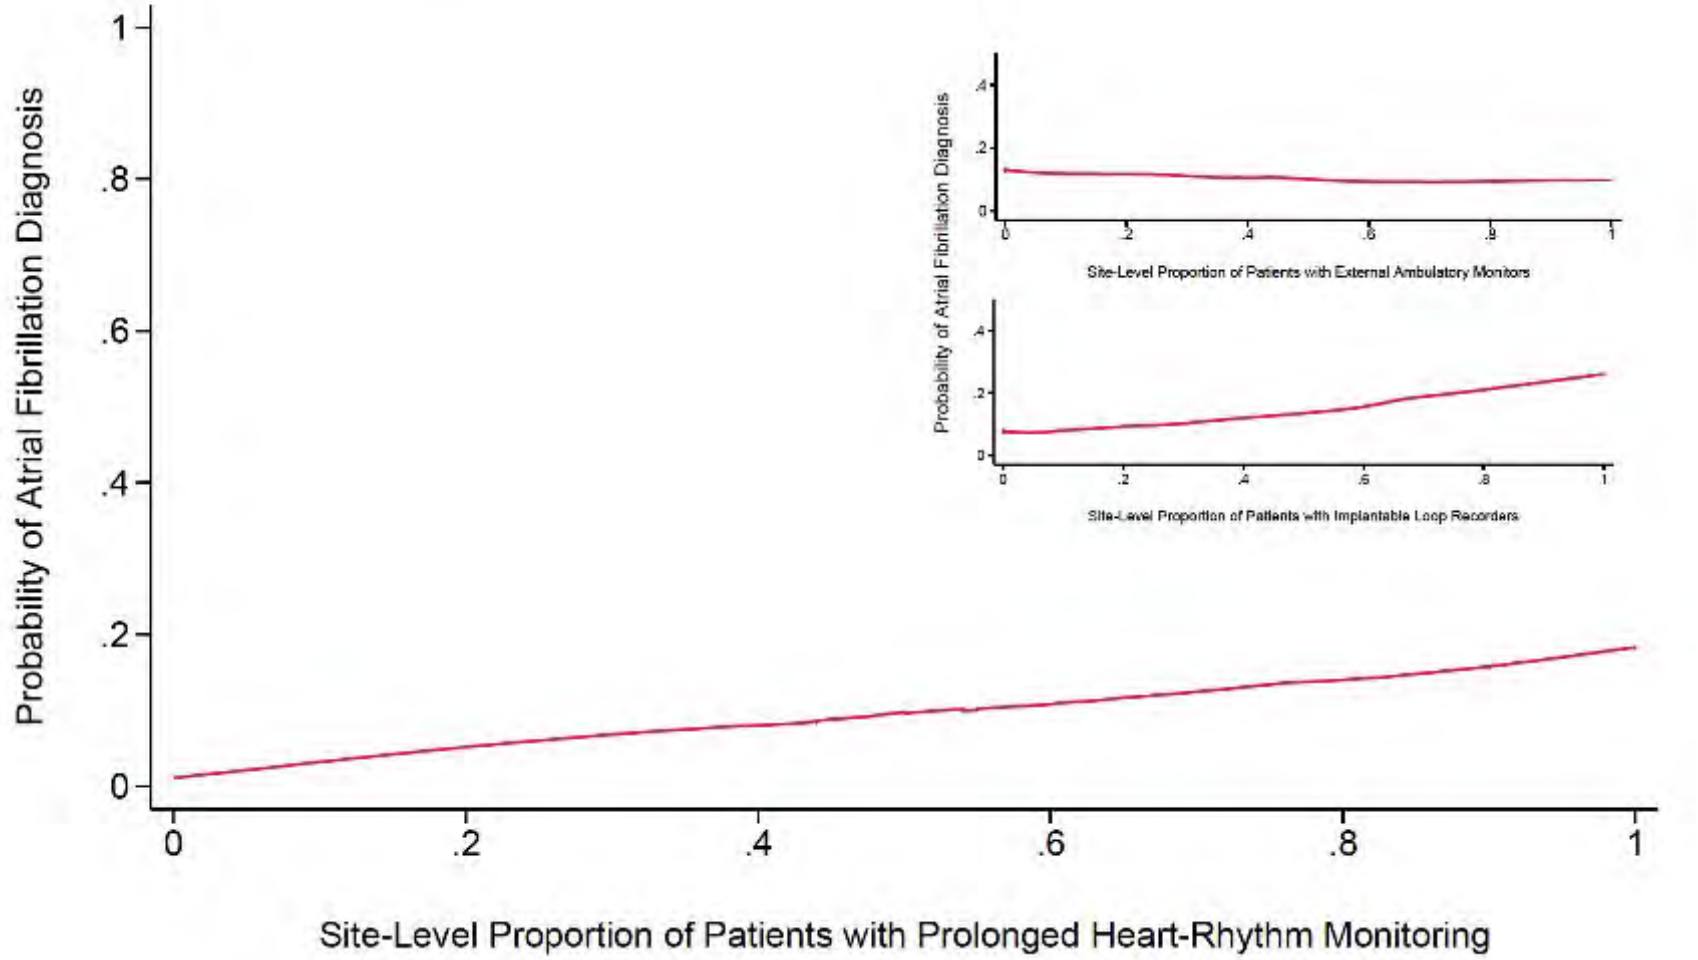
Characteristic	Risk Ratio (95% CI)	*P* value
Age (per decade)	1.04 (1.00-1.08)	0.047
Female sex	1.07 (0.98-1.17)	0.14
Asian, Black, Hispanic, or other race-ethnicity	0.84 (0.74-0.95)	0.006
Modified Rankin Scale (per point)	0.97 (0.93-1.01)	0.12
National Institutes of Health Stroke Scale (per point)	0.98 (0.96-1.00)	0.037
Peripheral artery disease	0.71 (0.49-1.05)	0.09

Figure 2. Distribution Across Sites of the Proportion of Patients Undergoing Prolonged Heart-Rhythm Monitoring.



Only sites with >10 patients in this sample are shown (96 sites had ≤10 patients and 55 had >10 patients).

Figure 3. Relationship between Site-Level Proportion of Patients Undergoing Prolonged Heart-Rhythm Monitoring and Detection of Atrial Fibrillation.



Limitations

- Lacked detail on precise type and duration of monitoring
- Data available for only a subset of trial participants
- Potential confounding in association between monitoring and AF

Conclusions

- Prolonged heart-rhythm monitoring appears fairly widespread at North American stroke centers participating in stroke trials
- More monitoring at site level associated with greater risk of AF detection
- Substantial practice variation and sociodemographic disparities
- Future studies needed to identify optimal and equitable strategies for assessing risk of cardioembolic stroke after cryptogenic stroke

Other Secondary Analyses of the ARCADIA Trial

Hooman Kamel for the ARCADIA Investigators

Pending paper topics

- Cancer
- LV injury
- Brain infarction in multiple arterial territories
- Vascular risk factors and effect of anticoagulation

Priority Setting Conferences

NIH StrokeNet initiative to guide stroke research priorities

Pooja Khatri, MSc

GOAL: Conferences on Dedicated Scientific Themes

Comprehensive Review

A full consideration of a single scientific theme, drawing insights from key stakeholders and experts in an open forum, to develop research priorities and opportunities within that theme.

Diverse Perspectives

This includes perspectives from clinical researchers, preclinical scientists, patient representatives, DEI experts, and methodologists.

Resulting White Paper

The paper will guide trial proposers, peer review and funders.

.

Themes Proposed by Working Groups To Date

Emphasizing scientific themes over methodology was the guiding principle.

Acute

- Addressing barriers in rural and underserved communities
- Ultra-early interventions including pre-hospital treatments and diagnosis
- Neuroprotection

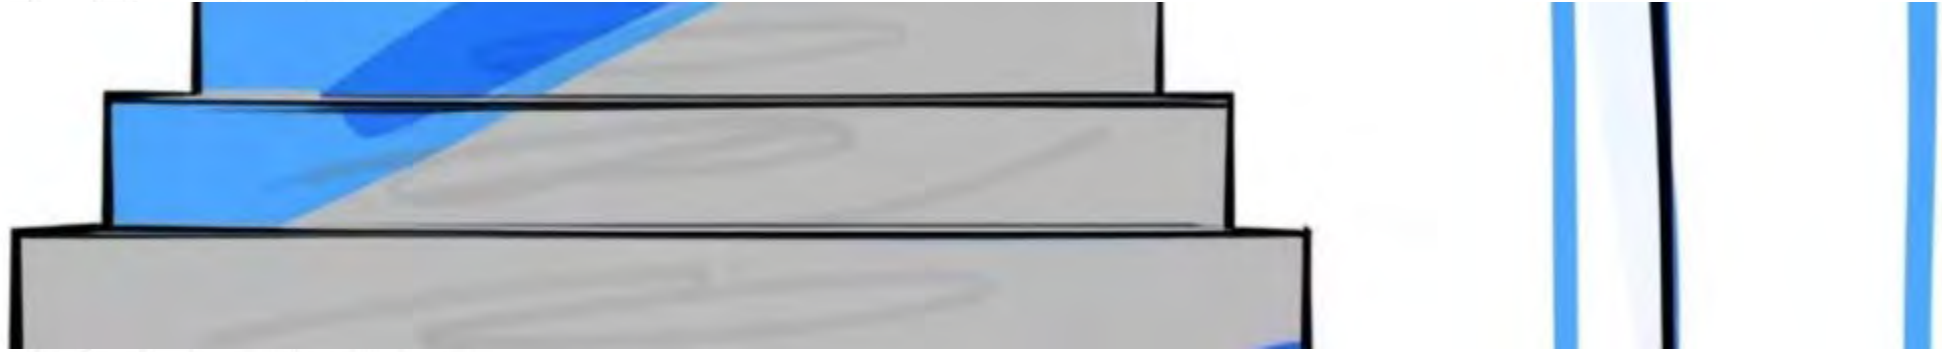
Prevention

- Cerebral small vessel disease (CAA, hypertensive ICH, etc.)
- Novel approaches to vascular risk factor management (obesity, microbiome, diet, cardiometabolic)

Recovery/Rehab

- Very high-dose rehabilitation
- Combining rehab with neuromodulation (brain stimulation, drugs)
- Rehab models for rural settings
- Technology-based interventions and long-term sustainability

NIH StrokeNet
PREVENTION | TREATMENT | RECOVERY



Next Steps

1

Current Meeting

Breakout rooms according to domain. Seeking diverse of thought.

2

Working Group and Executive Committee Review

Working Groups and Executive Committee will consider input from fall meeting.

3

Theme Selection

Themes will be presented to the NINDS for review and consideration. A theme will be selected by NINDS for the first conference.

4

Conference Development

Volunteers from StrokeNet community will be sought for a Task Force to develop the first conference grant proposal for that particular scientific theme.

Breakout Room Activity

1

Review Themes

Carefully examine the **scientific themes proposed by each working group.**

2

Prioritize Themes

Identify the **most important and impactful themes for future stroke research.**

3

Refine Suggestions

Narrow down the **list of suggested themes** or propose **alternate priorities** that emerge from the discussion.

4

Share Findings

Provide a **summary of your group's discussion and recommendations** to larger group.

A StrokeNet trainee in each room has been asked to take notes

WG Chair(s) will also be in respective breakout room to hear and participate in discussions

Moderators will provide 10-min summaries to larger group to weigh in

Consider the following aspects for each potential scientific theme:

Reasons that theme may be timely

Challenges in bridging evidence and practice

Opportunities for pragmatic and decentralized approaches

Challenges related to race/ethnic, geographic, and socioeconomic disparities

Types of stakeholders needed for the conference

More on Themes Proposed by Working Groups:

RECOVERY/REHAB: Steve Cramer

ACUTE: Karen Johnston

PREVENTION: Hooman Kamel

Themes for priority setting conferences

Complexities of stroke recovery/rehabilitation research

(1) Some positive trials (EXCITE, L-Dopa, FLAME, TR, VNS)

(2) Many treatment targets, many endpoints

(3) Multidisciplinary teams, in patient care and in clinical research

(4) Patients are scattered to the 4 winds

- Very very very high doses of rehab therapy
- Combining intensive therapies with neuromodulation (i.e., taVNS, TMS, and pharmacological interventions)
- Rehabilitation models for clients in rural settings or geographically remote areas and other marginalized groups
- Technology-based interventions; long-term effects, sustainability

NIH StrokeNet
PREVENTION | TREATMENT | RECOVERY

Why it's timely: Increased momentum in recovery/rehab therapeutics

Challenges in bridging the gap between evidence and changing practice: mounting evidence, weak translation to clinical practice

Opportunities for pragmatic and decentralized approaches: needed, but complex given variability in clinical practice

Challenges related to geographic and socioeconomic disparities: wide geographic variation in rehab practice, high impact of socioeconomic factors

Types of stakeholders needed: numerous, e.g., patients, OT, PT, SLP, RN, MD, neuropsych, hospital CEOs, industry, etc

- Very very very high doses of rehab therapy
- Combining intensive therapies with neuromodulation (i.e., taVNS, TMS, and pharmacological interventions)
- Rehabilitation models for clients in rural settings or geographically remote areas and other marginalized groups
- Technology-based interventions; long-term effects, sustainability

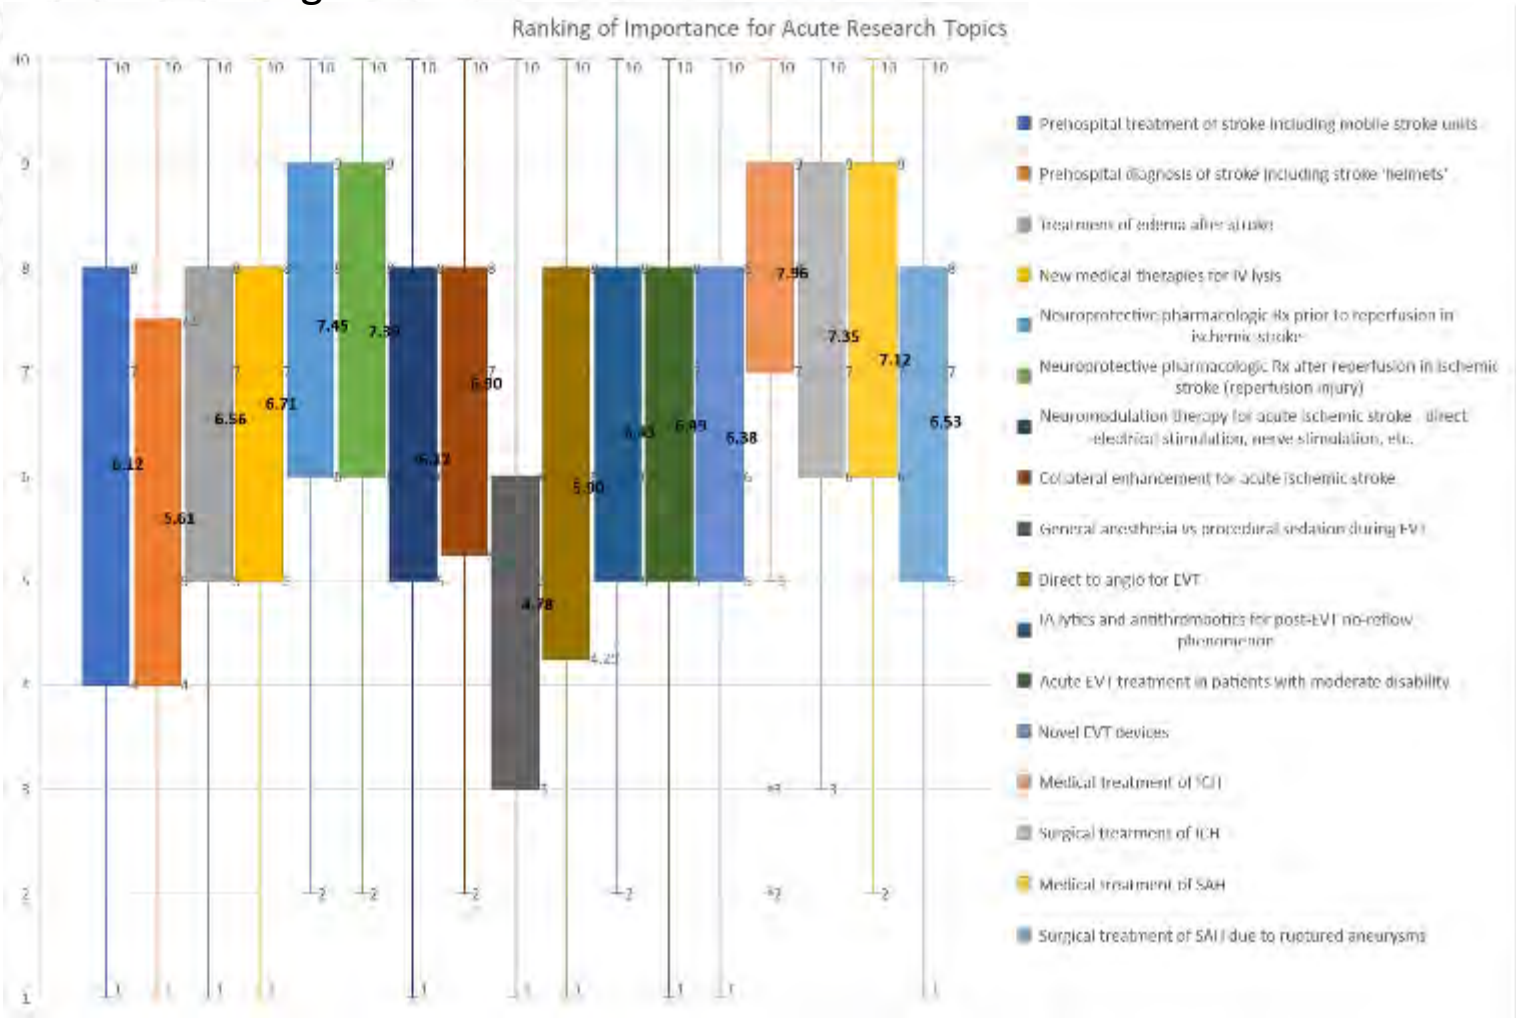
StrokeNet Acute Stroke Priorities in 2023

1. Medical Treatment for ICH
2. Neuroprotection
3. Medical and Surgical Treatment for SAH



2024 Acute Stroke Themes for Discussion

- 1. Address barriers to getting acute stroke trials and treatments to rural and underserved communities
- 2. Ultra-early intervention (Prehospital diagnosis and treatment of acute stroke)
- 3. Neuroprotection

NIH StrokeNet
PREVENTION | TREATMENT | RECOVERY

Acute Stroke Rx to Rural & Underserved Patients

- EVT and many of our research interventions are not available at rural (geographically challenged) and underserved hospitals
- Longer times to treatment and reduced treatment options for rural and underserved patients contribute to disparities in outcomes
- Transfer to a stroke center is more common
- Pragmatic and decentralized trials could contribute to the StrokeNet portfolio
- **How can StrokeNet leverage our network to address treatment gaps for rural and underserved communities?**

Ultra Early, Pre-Hospital Interventions

- Mobile stroke units (MSU) can facilitate prehospital diagnosis, treatment and research efforts
- By far, the majority of stroke patients will not be transported by MSU
- Healthcare technologies (e.g., phone apps, wearable technology, point of care testing) and AI analytic technologies (ML, NLP, LLM) are ripe to be used in innovative ways for acute stroke detection and/or subtyping
- **How can StrokeNet utilize new technologies to transform prehospital care in the fleet of regular ambulances?**

NIH StrokeNet
PREVENTION | TREATMENT | RECOVERY

Neuroprotection

- New opportunities for neuroprotection exist with EVT, the STEP platform, and the SPAN network
- Pre-EVT – Preservation of salvageable ischemic tissue during transport to thrombectomy center
  - Initial transport from field (MSU or standard ambulance)
  - Secondary transport from rural and underserved hospital
- Post-EVT - Post thrombectomy treatment to reduce reperfusion injury

How can we leverage our StrokeNet, STEP, and SPAN infrastructure to implement the next phase of neuroprotection trials?

Challenges in Priority Area #1

Low rates of recurrent stroke after small-vessel occlusion

Broader outcomes that are relevant, feasible, acceptable?

Combined populations (e.g., deep ICH + lacunar stroke)?

	Higher-target group (n=1519)		Lower-target group (n=1501)	
	Number of patients	Rate (% per patient-year)	Number of patients	Rate (% per patient-year)
Stroke				
All stroke	152	2·77%	125	2·25%

Blood-pressure targets in patients with recent lacunar stroke: the SPS3 randomised trial

*The SPS3 Study Group**

Challenges in Priority Area #2

What will shift guidelines? Do we always need stroke-specific trials?

4.4. Glucose

Recommendations for Glucose
Referenced studies that support recommendations are summarized in online Data Supplements 14 and 15.

COR	LOE	Recommendations
1	B-R	2. In patients with an ischemic stroke or TIA who also have diabetes, treatment of diabetes should include glucose-lowering agents with proven cardiovascular benefit to reduce the risk for future major adverse cardiovascular events (ie, stroke, MI, cardiovascular death).[231–236]

Challenges in Priority Area #2

What will shift guidelines? Do we always need stroke-specific trials?

EXPLANATORY ⟷ **PRAGMATIC**

What does a “pragmatic trial” even mean, really?

- Is pragmatic a dirty word?
- What is does NOT mean:
  - Less rigorous
  - Making design choices because they make life easier *for the trialist*
  - Evaluating only nudges, decision support, or other implementation interventions
  - Poor separation between groups
  - Poor data on the delivery of the intervention
  - Lack of granularity in the outcome
  - Loss to follow up in outcome assessment
  - Analysis using methods that don’t account for biases
  - Imbalance in importance covariates or cointerventions

Password to the PCCRG website since 2014 = “Pragmatic_does_not_mean_crappy”

NIH StrokeNet
PREVENTION | TREATMENT | RECOVERY

What does “pragmatic trial” even mean, really?

NIH Collaboratory defines a pragmatic clinical trial as a study that takes place in real-world healthcare settings to evaluate the benefits and risks of treatment options. The goal of a PCT is to provide evidence that can be applied to real-world practice and inform policy.

	What is the purpose?	What question does it answer?	Who is enrolled?	Who collects data?	What is studied?	What is compared?	What is the setting?	Adherence to the intervention	Outcomes
Explanatory Trial	Create generalizable knowledge; determine causes and effects	Can this intervention work under ideal conditions?	Selected patients who meet strict inclusion and exclusion criteria	Researchers; data collection occurs outside of clinical care	A biological or mechanistic hypotheses	Treatment vs placebo or non-treatment	Medical centers designated as research sites	Strictly enforced	May be surrogates or process measures
Pragmatic Trial	Create generalizable knowledge, improve care locally, and inform clinical and policy decisions	Does this intervention work under usual conditions?	Diverse, representative populations who meet broad eligibility criteria	Clinicians at the point of care; EHRs; registries	The comparative balance of benefits, burdens and risks of an intervention	The comparative effectiveness of real-world alternatives	Multiple, heterogeneous settings	Flexible (as it would be in usual care)	Directly relevant to participants, funders, communities, and healthcare practitioners

What does a “pragmatic trial” even mean, really?

No trial is “pragmatic” or “explanatory” –
In every trial, investigators must choose where each trial procedure should lie on the spectrum.

EXPLANATORY ⟷ **PRAGMATIC**

"More efficient" – why is it important for patients that our trials be more efficient?

Treatments administered to millions of critically ill patients each year in routine clinical care that would never have been examined in an explanatory randomized trial.

Higher vs lower SpO2 targets

HFNC vs NIV vs COT in AHRF

Mode of ventilation

Saline vs balanced crystalloids

albumin vs crystalloids in septic shock

Restrictive vs liberal fluid management in sepsis

fluid responsiveness measures to guide fluid therapy

etomidate vs ketamine

sedative-first vs NMB-first

video vs direct laryngoscopy

hyperangulated vs standard geometry

Bag-mask ventilation vs none during intubation

NIV vs HFNC vs BMV

neuromuscular blocker vs none

"apneic oxygenation" vs none

fluid bolus vs none

bougie vs stylet

vasopressor vs none

ramped vs sniffing position

Traditional explanatory trials focus on new drugs and devices and neglect the comparison of existing therapies that patients are exposed to in care – "a profound moral problem"

NIH StrokeNet
PREVENTION | TREATMENT | RECOVERY

Part 2

Now that you're completely convinced to do pragmatic trials, what are some key aspects of designing and conducting a pragmatic trial?

#1 What questions are a good fit for pragmatic trials?

- **Trials comparing the effectiveness of existing treatment alternatives (A vs B designs)**
- **Trials evaluating a new approach to care delivery (A vs A+ design)**
- **NOT trials evaluating a new drug or device (A vs placebo design)**

Higher vs lower SpO2 targets

HFNC vs NIV vs COT in AHRF

Mode of ventilation

Saline vs balanced crystalloids

albumin vs crystalloids in septic shock

Restrictive vs liberal fluid management in sepsis

fluid responsiveness measures to guide fluid therapy

PREVENTION | TREATMENT | RECOVERY

#2 What are some key tools for a pragmatic trial?

Characteristic of Emergency & Critical Care Environment	RCT Procedure	Tool for Pragmatic Trial
Brief therapeutic window	Screening Enrollment Randomization Intervention Delivery	Embed RCT procedures within people & systems of clinical care
Low ‘signal-to-noise’ from complex acute and chronic conditions (low attributable risk) and limited time to phenotype	Sample size	Leveraging information technology tools and the EHR to facilitate each RCT procedure
Lack of decisional capacity & surrogates	Informed consent process	EFIC, waiver, and ‘the gray space’ for comparative effectiveness RCTs
Heterogeneity of patients in response to therapy	Analysis of treatment effect	Large sample size & analysis of ‘heterogeneity of treatment effect’ and ‘individual treatment effect’

0 randomized trials to inform best approach to emergency tracheal intubation.

PREO2XI

PRagmatic trial Examining OXygenation prior to Intubation

- Multicenter, parallel-group, randomized trial
- 24 EDs and ICUs across the US
- Eligibility Criteria
  - Inclusion
    1. Undergoing tracheal intubation in a participating unit using a laryngoscope and sedation
  - Exclusion
    1. Patient is <18 years old, pregnant, or a prisoner
    2. Patients is already receiving positive pressure ventilation
    3. Immediate need for tracheal intubation precludes safe performance of study procedures
    4. Clinician has determined that preoxygenation with non-invasive positive pressure ventilation or preoxygenation with a facemask is required or contraindicated for optimal care of the patient

PREO_2XI

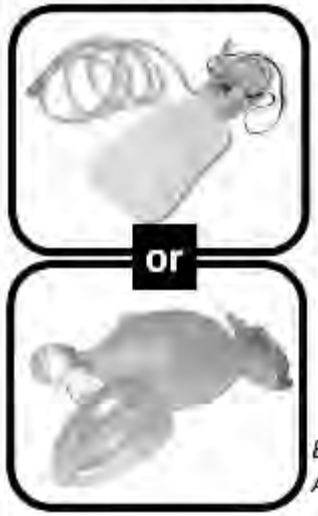
PRagmatic trial Examining OXygenation prior to Intubation

- Clinician perform , Criteria)
- Clinician opens envelope (Trial Enrollment)
- Envelope contains trial group assignment (Randomization)
- Clinician delivers assigned intervention (Delivery of the Intervention)

Non-Invasive Positive Pressure Ventilation

1. Apply BiPAP or ventilator via mask
2. Set
   - FiO2 = 100%
   - Expiratory pressure ≥ 5
   - Inspiratory pressure ≥ 10
   - Respiratory rate ≥ 10
3. Preoxygenate ≥ 3 min (if feasible)
4. Remove mask only as the laryngoscope blade enters mouth

Facemask Oxygen

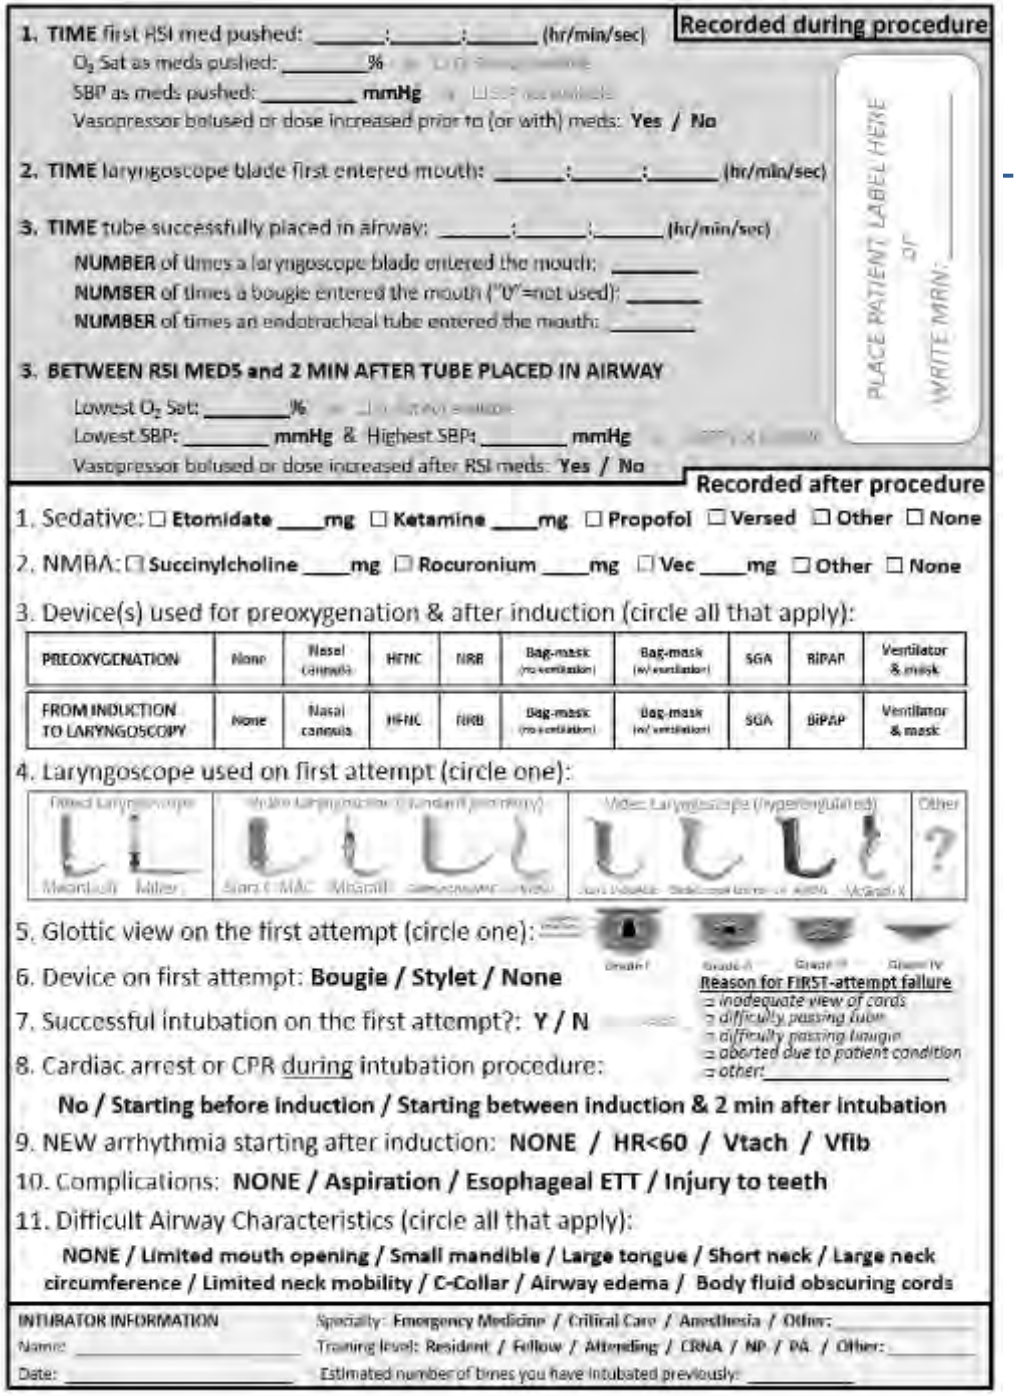


1. Apply non-rebreather or bag-mask
2. Set O_2 flow rate to max (≥ 15 LPM)
3. Preoxygenate ≥ 3 min (if feasible)
4. Remove mask only as the laryngoscope blade enters mouth

BEFORE INDUCTION – do NOT ventilate (squeeze bag)
AFTER INDUCTION – OK to ventilate (squeeze bag)

Data Collection

A second clinician not involved with the performance of the procedure collects data



Recorded during procedure

1. **TIME** first RSI med pushed: _____:_____:_____ (hr/min/sec)
   O_2 Sat as meds pushed: _____%
   SBP as meds pushed: _____ **mmHg**
   Vasopressor bolused or dose increased prior to (or with) meds: **Yes / No**
2. **TIME** laryngoscope blade first entered mouth: _____:_____:_____ (hr/min/sec)
3. **TIME** tube successfully placed in airway: _____:_____:_____ (hr/min/sec)
   NUMBER of times a laryngoscope blade entered the mouth: _____
   NUMBER of times a bougie entered the mouth ("0"=not used): _____
   NUMBER of times an endotracheal tube entered the mouth: _____
3. **BETWEEN RSI MEDS and 2 MIN AFTER TUBE PLACED IN AIRWAY**
   Lowest O_2 Sat: _____%
   Lowest SBP: _____ **mmHg** & Highest SBP: _____ **mmHg**
   Vasopressor bolused or dose increased after RSI meds: **Yes / No**

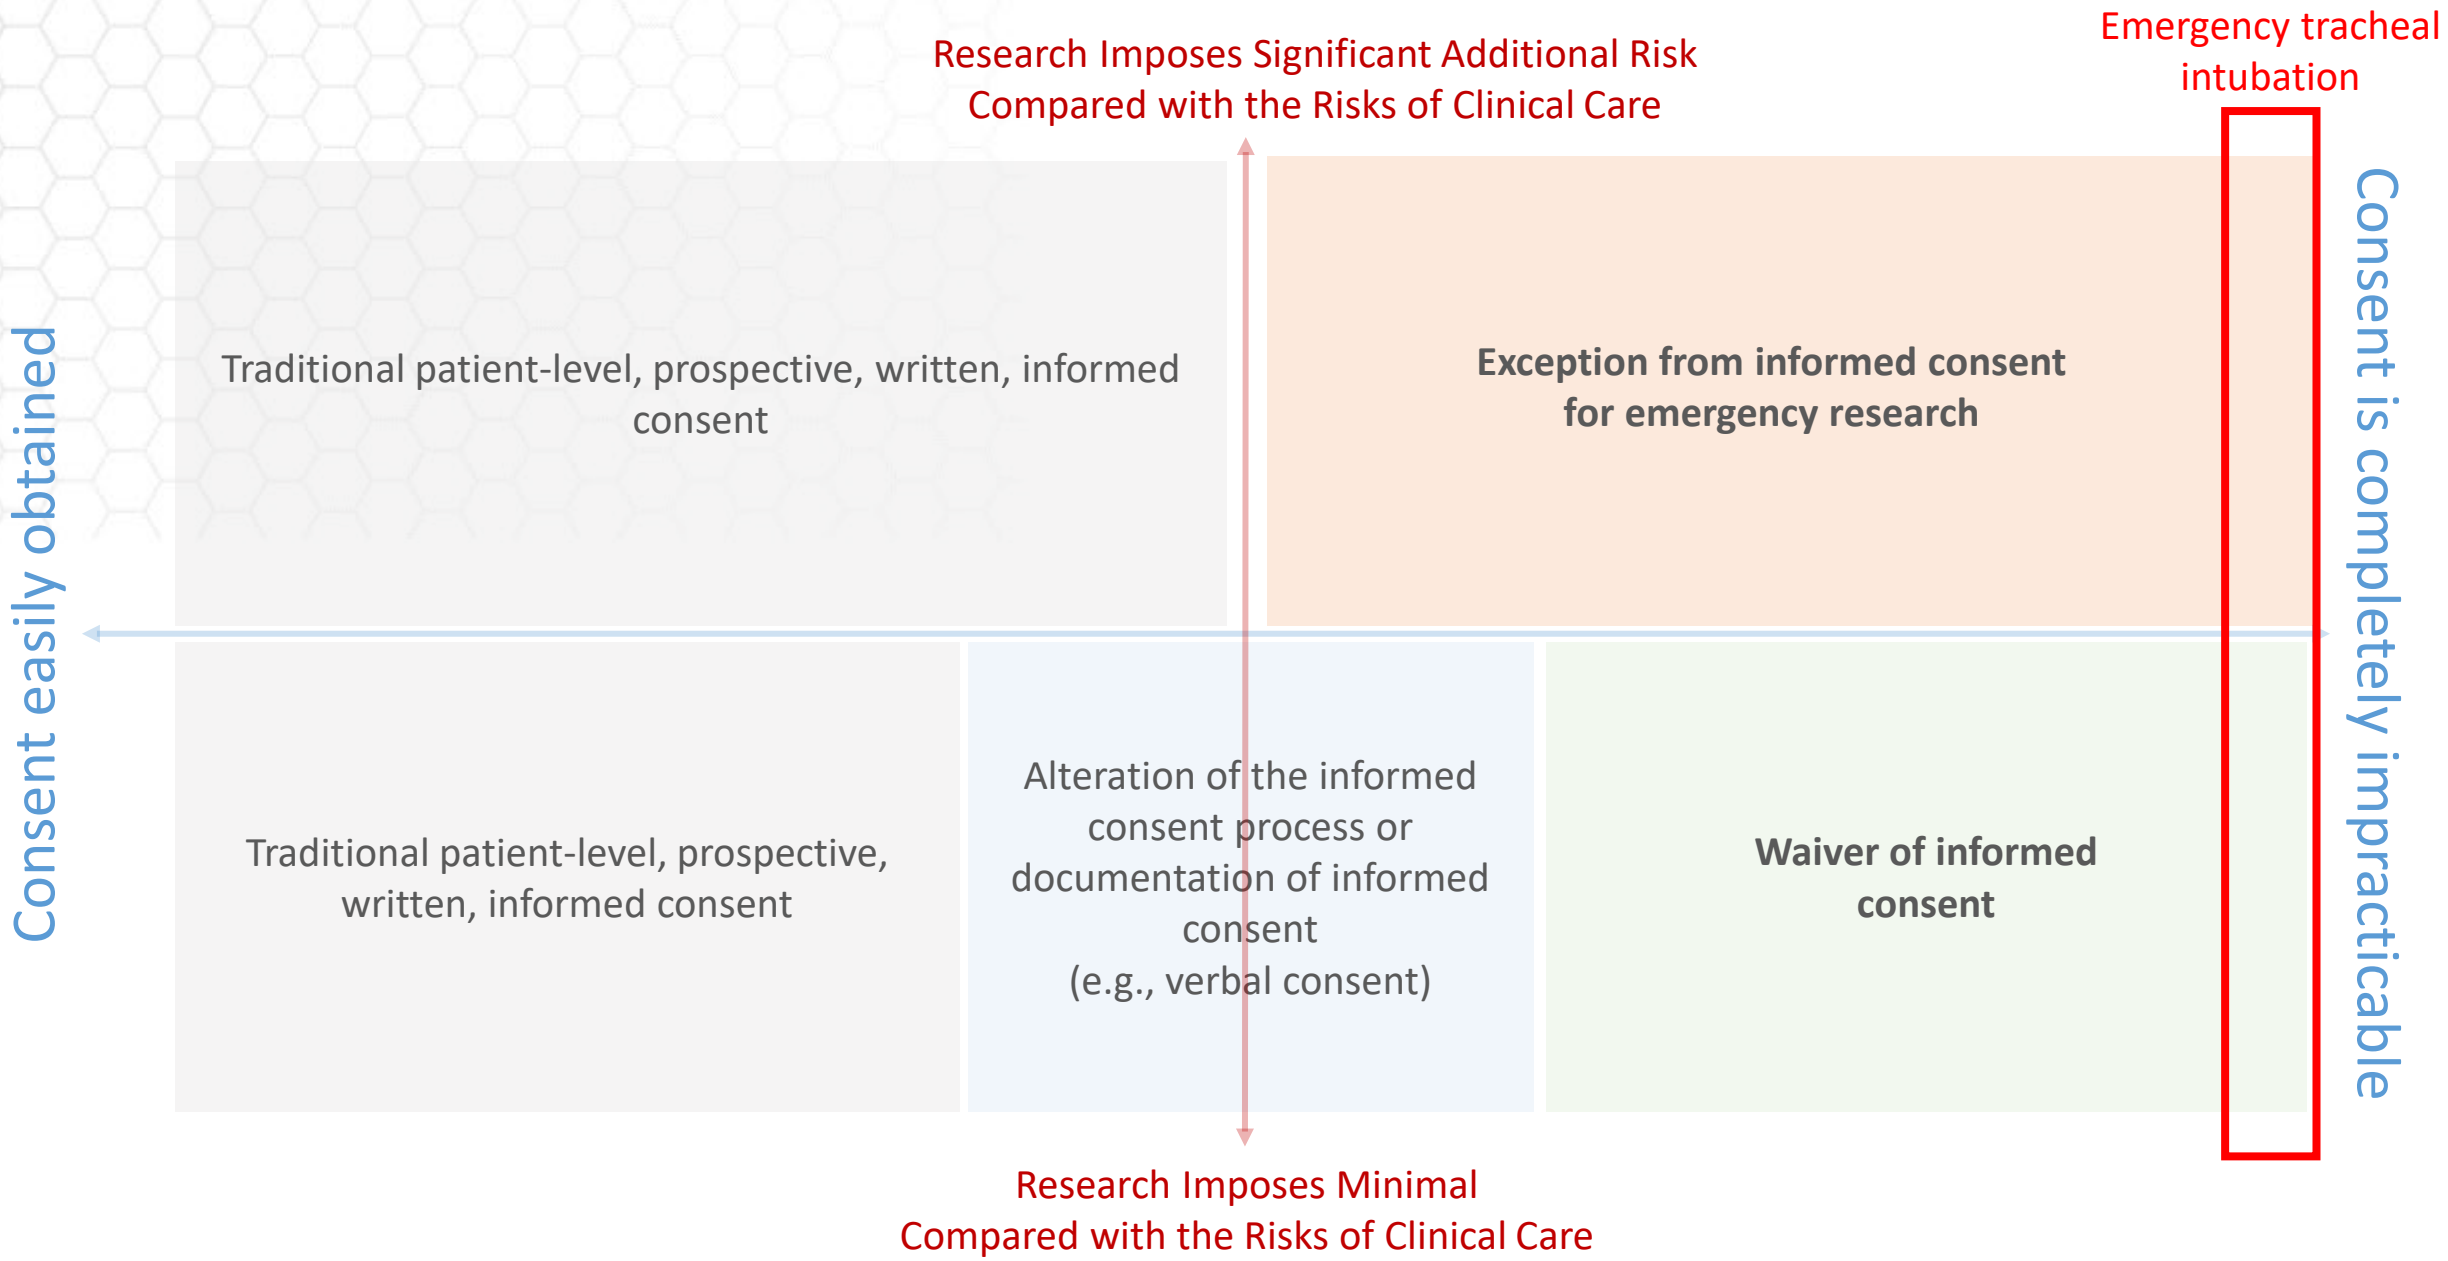
EFIC, alteration, and waiver of informed consent in pragmatic trials in emergency medicine and critical care

NIH StrokeNet
PREVENTION | TREATMENT | RECOVERY

Current Regulations for Informed Consent



Waiver of Informed Consent

Criteria for waiver of informed consent (45 CFR 46.116(f))

1. **No more than minimal risk to patients**
2. Could not be carried out without the waiver;
3. Only uses identifiable private health information if such information is required to conduct the study
4. Does not adversely affect patients' rights or welfare
5. Whenever appropriate, additional pertinent information is provided after participation.

Why is there controversy on the role of EFIC and waiver in comparative effectiveness research?

FDA Commissioner:

"***Neither HHS nor FDA regulations currently have guidance on whether or when [pragmatic trials] might be categorized as minimal risk . . . These issues need the joint attention of federal agencies, the research community, the health care delivery ecosystem, and patient advocates***"

GUEST EDITORIAL

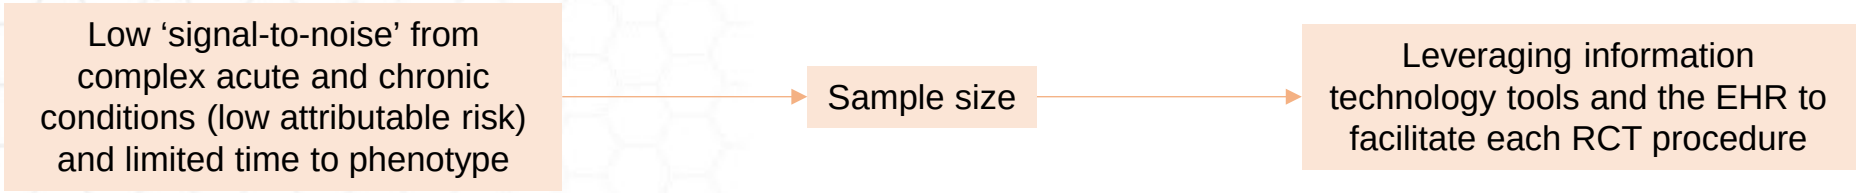
Challenges in the Ethics and Implementation of Learning Health Care Systems

Robert M. Califf, Ruth Faden, Nancy Kass, Stephanie Morain, and Matthew Crane

U.S. Food and Drug Administration

Pragmatic clinical trials (PCTs) serve an important function in the modern research landscape: studying interventions in an environment that reflects real-world conditions, rather than the relatively stringent atmosphere of traditional explanatory trials (Sugarman and Califf 2014). When PCTs are conducted in a reciprocal cycle of knowledge generation and care improvement, they also contribute significantly to fulfilling the goals of a learning health care system (Committee on the Learning Health Care System in America, and Institute of Medicine 2013; Faden et al. 2013). The potential of PCTs to drive health care improvement stems in part from differences in design from explanatory trials, including most notably the ways in which some PCTs are embedded more or less seamlessly into routine clinical care. However, these differences can also raise different eth-

Sugarman 2023). Complementing this work, the article by Morain and Largent identifies a critical issue in embedded research that is likely to become of only greater importance—what should happen when clinically relevant information is identified in embedded research where informed consent has been justifiably waived and patients are thus likely unaware that their data are being used in research activities such as PCTs? The authors show how morally relevant distinctions between traditional explanatory research and embedded research mean that the strategies advocated for the handling of incidental findings in conventional RCTs are not sufficient when similar challenges emerge in embedded research, and raise some helpful suggestions for an ethical path forward (Morain and Largent 2023).



Leveraging the EHR to facilitate trial procedures

Using EHR to efficiently conduct trials large enough to detect small differences in patient-centered outcomes between existing treatments

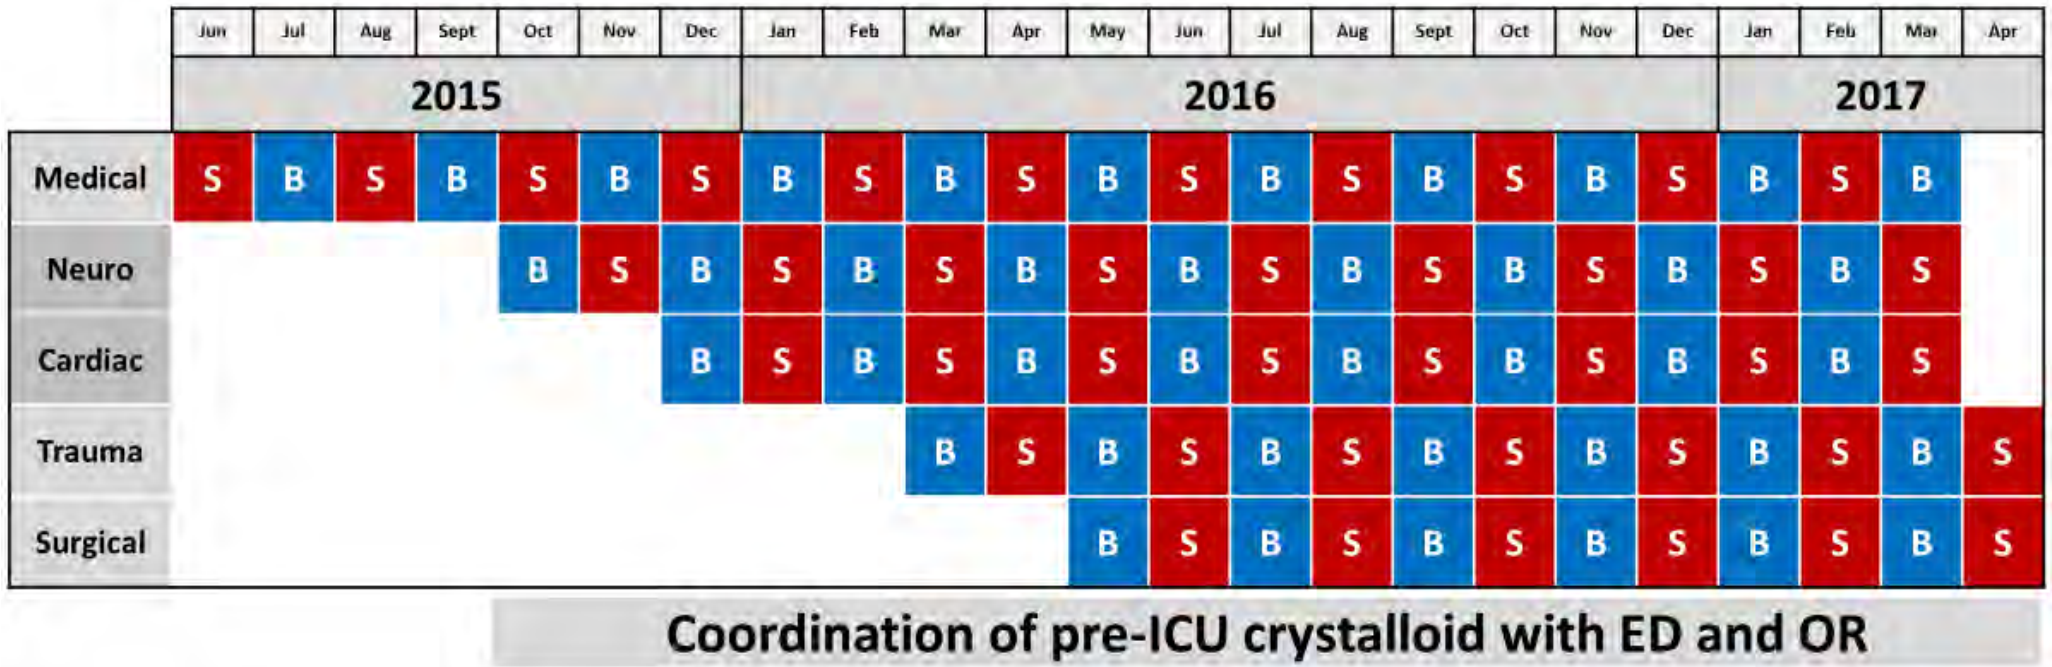
Balanced Crystalloids

Saline

	Na^+	Cl^-	K^+	Ca^{2+}	Mg^{2+}	Organic anion
0.9% saline	154	**154**				
Lactated Ringer's	130	**109**	4.0	2.7		+
Plasma-Lyte A®	140	**98**	5.0		3.0	+

Pragmatic trial of fluid management

- Isotonic Solutions and Major Adverse Renal Events Trial (SMART)
- Cluster-randomized, multiple-crossover trial
- Adults admitted to five ICUs at Vanderbilt



Step 1

Step 2

This patient has been assigned to receive LR or PLA for all isotonic fluid orders, unless a contraindication is present.

If a contraindication to LR and PLA is present, please select from the list below to order off-study IV fluid. Otherwise, please select option 1 to order LR or 2 to order PLA.

Select an option:

1 Order Lactated Ringer's bolus
2 Order Plasma-lyte bolus
3 Hyperkalemia
4 Brain injury
5 Specific attending request

What do trial personnel do in pragmatic trial?

PREOXI Trial

- Train clinicians in trial procedures
- Monitor exclusion vs enrollment
- Verify eligibility after enrollment
- Monitor receipt of intervention
- Provide feedback to clinicians
- Collect data on baseline characteristics and hospital outcomes
- Monitor for AEs
- Communicate with patients and families after enrollment
- Address queries

#3 How to deal with grant reviewer #2

- The scientific and regulatory infrastructure for randomized trials in the US was built for the development of new drugs and devices
- For decades, the NIH and the scientific community have largely conceived of “randomized trials” as explanatory, mechanistic trials
- Peer reviewers may not understand or like trials with pragmatic features

- Our approach:
  - Early on, invest in executing pragmatic trials even without much funding
  - Develop a track record of execution and demonstrate value
  - Seek funders and RFAs that have shown openness to pragmatic trials
  - Jon NIH Collaboratory and other organizations advancing message
  - In grants, describe rigorous trial features without saying “pragmatic”
  - Await turnover in prior generation of scientists and peer reviewers

NIH StrokeNet
PREVENTION | TREATMENT | RECOVERY

Summary

- In every RCT, investigators determine the level of pragmatism for each trial procedure
- Trials with more pragmatic features can sometimes be “better” (more representative) or “more efficient” (shorter enrollment, lower cost)
- The efficiency of pragmatic trials may allow us to answer comparative effectiveness questions that are currently ignored (a moral imperative)
- Pragmatic trials are better suited to comparative effectiveness questions than to the development of new drugs and devices
- Key tools for pragmatic trials are:
  - Embedding trial procedures within clinical care
  - Leveraging the electronic health record to facilitate trial procedures
  - Understanding and appropriately applying EFIC, alteration, and waiver for informed consent
- Barriers to pragmatic trials today are as much cultural or dogmatic as they are scientific or logistical
